

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. LETTER OF TRANSMITTAL.

DEPARTMENT OF COMMERCE AND LABOR,
BUREAU OF THE CENSUS,
Washington, D. C., July 16, 1906.

SIR:

I have the honor to transmit herewith a report on the insane in hospitals, and on the feeble-minded in special institutions for this class. The report is issued in accordance with the provisions of section 7 of the act of Congress of March 6, 1902.

The investigation was made under the direction of Mr. John Koren, expert special agent, who is responsible for the methods pursued and the scope of the inquiry, as well as for the textual treatment of the results.

The first part of the report deals with the inmates of public and private hospitals for the insane in the United States. It covers the number of insane present in hospitals on December 31, 1903, and the number of admissions, discharges, deaths, and transfers during 1904. For the first time in these reports the movement of the insane population has been measured for the space of one year and studied in the light of personal statistics.

The second part of the report treats of the feeble-minded in the United States who are inmates of public and private institutions especially designed for them; and, in the main, the same method of inquiry was followed as in regard to the insane.

The work of collecting and compiling the data was performed by the regular clerical force of the Bureau, under the supervision of the late William A. King, chief statistician for vital statistics.

Very respectfully,

Director.

Hon. VICTOR H. METCALF,
Secretary of Commerce and Labor.

(v)

INSANE IN HOSPITALS

INSANE IN HOSPITALS.

By JOHN KOREN, Expert Special Agent.

SCOPE OF INQUIRY.

Previous to 1880 the census enumerations of the insane in the United States were more or less incomplete. Indeed, the resulting statistics have been characterized as "entirely worthless so far as the calculation of ratios of number of insane to population is concerned, since the number of insane returned in these censuses was certainly less than half the number actually present."

At the Tenth Census, 1880, the returns of the enumerators were supplemented by special schedules filled out by physicians. About 17 per cent of the total number of insane accounted for in that year were reported by physicians. The cooperation rendered by medical practitioners was therefore very extensive, although the returns show plainly that it was much less thorough in some states than in others, and resulted, in certain instances, in misleading ratios. This method of enumeration was not pursued at the Eleventh Census, taken in 1890, but the population enumerators counted as before all of the insane coming within their knowledge, whether found in or outside of institutions.

The conditions under which the statistics contained in this present report were collected necessitated some departures from previous methods of enumerating the insane. The census act of March 6, 1902, provided that the statistics of special classes, including the insane, should be restricted to institutions containing such classes, and that the enumeration should not be undertaken until after the completion of the census of population, agriculture, and manufactures. This precluded the employment of the usual census enumerators. Instead, the schedules were filled out for each institution by the head or a subordinate designated for this purpose as a special agent of the Bureau of the Census.

The term "insane" is necessarily vague unless applied to persons whose insanity has been established by experts, since the character or degree of mental unsoundness which constitutes insanity can not be accurately determined by the layman. Therefore, to avoid the introduction of uncertain elements into these statistics, no attempt has been made to secure an enumeration of the inmates of any institutions other than the public and private hospitals treating only the insane,

or having a separate department for the treatment of this class of patients. This restriction excludes the many persons known to be in almshouses who are commonly considered insane, as it would manifestly be impossible to obtain a proper differentiation of the really insane in almshouses from those who are merely weak-minded.

So far as it is the fundamental object of a census of the insane to measure their number in the country, the present report does not quite accomplish it, since no cognizance could be taken of the insane who are not subject to any form of institutional restraint. At the enumeration of 1890 no less than 32,457 insane were included who were not inmates of hospitals. It may be presumed that nearly one-half were found in almshouses and the remainder in private families. That an equally large or perhaps larger number of insane have not been accounted for in this report must be taken for granted. The statistics of paupers in almshouses for 1904 give 11,807 inmates as insane; and unquestionably a diligent search would have shown a larger number of insane persons who have not passed into the care of any institution.

What influence the restricted scope of the present enumeration has upon conclusions in regard to the growth of insanity since the last census, and how far it weakens comparisons with ratios obtained in other censuses, will be discussed later.

The census of 1890 showed the number of insane by cities and other civil divisions of states. Under an enumeration confined to inmates of special institutions, the state is necessarily the only fair unit of comparison. It was found impossible to charge the insane in institutions to the cities or counties to which they belong so accurately as not to incur the risk of attributing to certain localities, particularly those in the vicinity of asylums, a larger proportion of insane than belong to them. In order to establish definitely the ratios of insane in each city and county, a much more extended investigation would be required than the Government hitherto has found it feasible to attempt. One may also fairly question the scientific value of comparing the ratios of insane for restricted areas separated only by artificial boundary lines and inhabited by fairly homogeneous populations living under the same laws. Until the relative growth or diminution of insanity in general can be determined, such questions as the influence of climatic and industrial conditions and of urban

¹ Report on the Insane, etc., Eleventh Census, 1890, page 7.

as compared with rural life, can safely be kept in abeyance.

The Census report on the insane for 1890 deals extensively with certain forms of insanity. The numbers afflicted with each form were shown by sex, age, color, race, and nativity, together with the ratios to total insane, both in and outside of institutions, etc. Upon the unhesitating advice of prominent alienists, it was decided not to ask for returns with distinction as to forms of insanity. There is no standard or universally adopted classification of mental diseases in this country. While the reports of the hospitals for some states show a degree of conformity in this respect, it is not the rule. Varying definitions occur even in reports from hospitals within the same state. The existing divergencies in classification might perhaps have been harmonized to a limited extent in an enumeration made by a few experts with ample time and opportunity for examination. But to have taken cognizance of the forms of mental diseases in returns supplied by many different officials who undoubtedly would have presented a classification made in accordance with the method followed by their institutions, regardless of its conflict with that in vogue elsewhere, would merely have led to confusing totals devoid of all scientific value.

Changes are constantly creeping into the nomenclature of the various manifestations of insanity and are more or less readily adopted. In general, the classifications now followed have undergone modifications since the last census of the insane. Therefore no exact comparisons could be made with earlier returns; nor is there any guarantee that the current nomenclature will not in part be discarded ten years hence. As alienists are not in agreement as to the classification of forms of insanity, statisticians certainly should not attempt comparisons of these forms. Moreover, there will always enter into this question the perhaps insuperable obstacle of the personal equation.

While it was imperative that the present enumeration should be limited to institutions, and although it seemed wise to discontinue some of the compilations made at the last census, advantage was taken of the opportunity afforded to broaden the inquiry in other respects. Hitherto all reports on the insane have dealt with the number of such persons living in the United States on a given date. Until a permanent Bureau of the Census was established, no reliable study could be made of the movement of the insane population in institutions, which would show by states and elements of population the number of admissions, discharges, deaths, and transfers that occurred during a definite period. These facts, covering the year 1904, are now supplied, in addition to the statistics of the entire insane population in hospitals on a given date. Thus, for the first time, it is possible to state with precision the annual increment in the number of insane, so far as it appears in the population of the hospitals for this class, and the number annually returned to the

different communities from institutions, together with their condition at discharge.

Another important consideration is that personal statistics of the insane lose much in value when made to relate to the entire number enumerated without regard to the fact that very many thus counted would be old patients who already may have figured in one or more censuses. A far more important statistical picture is obtained by a separate tabulation of cases admitted as insane during a stated period of time, because it discloses the condition of those who are added to the number of insane present on a given date, as well as the elements of population from which they come. As a basis for comparisons in succeeding censuses the separate consideration of admissions, discharges, and deaths during a year should prove invaluable.

If the limitations imposed by law on the present enumeration and the lack of trustworthy material in regard to the various phases of insanity were such as to prevent the making of an ideal report, it has nevertheless been possible to get a more comprehensive view of the insane than of any other defective or dependent class. The visible amount of pauperism in the community, for instance, bears intimate relation to the existing poor laws and the methods of their administration. Insanity, on the other hand, ordinarily comes to the surface, notwithstanding the abundance or absence of provisions for its care. When the disease becomes pronounced it demands immediate attention, and accordingly every state and territory furnishes institutional restraint and treatment. The growth or diminution of the insane population in institutions, therefore, provides a fairly reliable measure of the extent of the malady. Yet there are unquestionably very many insane who, although recognized as such, are at large in the community, and can only be found through a more extended investigation than the Government so far has seen fit to authorize. Until their number can be determined it is not the function of a statistical bureau to inquire into the subtler aspects of insanity as a disease. Therefore such studies as are made must be confined to the subjects of geographic distribution, sex, age, race, etc.

COMPARISONS WITH EARLIER CENSUSES.

Growth of hospitals for the insane.—On June 1, 1890, there were in the United States 74,028 insane patients distributed among 162 hospitals, of which 119 were public and 43 private institutions. On December 31, 1903, there were in the United States 150,151 insane patients distributed among 328 hospitals, of which 226 were public and 102 private institutions. This extraordinary increase of more than 100 per cent in the number of insane in hospitals, being accompanied by a corresponding increase in the number of institutions involved, at once raises the question whether the growth of insanity, indicated by the figures,

is so large as it seems, or whether it is due only to a more comprehensive enumeration.

The returns for December 31, 1903, show a total of 192 hospitals for the insane which do not appear in the report for 1890. Of these, 78 were private establishments, for the greater part of recent origin, although it is known that some of them, in particular the largest ones, were in operation at the time of the Eleventh Census. On the other hand, 26 hospitals, of which 19 were private establishments, appear in the returns for 1890, but not in those for 1902, as they had either closed or ceased to receive insane patients.

Among the 114 public hospitals not given in the report for 1890 there were 34 state and 80 county institutions. With two exceptions, however, these state institutions were all opened after the census of 1890 had been taken. In regard to the 80 county institutions, some of which are annexes of almshouses, while others have an independent existence, it is not definitely known in what years they first began to receive insane patients on commitments. It has been ascertained, however, that a majority of them were founded prior to 1890, although they were not reported in the census of that year.

Altogether the state hospitals which were established before 1890, but were not included in the census of that year, and all the county institutions which were either omitted in the enumeration of the Eleventh Census or founded subsequently, had a population on December 31, 1903, of 9,346. If to this be added the number of patients in the private hospitals that do

not appear in the report for 1890, the total would be only 11,635—a figure which admittedly not only exaggerates the numbers of insane in hospitals that could possibly have been overlooked in the enumeration of 1890, but does not in the least suffice to explain the apparent growth of insanity during the past thirteen years. In fact, the possible omissions in the census of 1890 yield a very much smaller total than the population on the given date in 1903 of the 34 state institutions erected since 1890, which was over 17,000.

Just how far the erection of new hospitals for the insane signifies an increasing ratio of insane in the population, or merely an enlightened public demand for proper hospital facilities for the care and treatment of the mentally sick, appears to be a somewhat mooted question. Asylums for the insane are practically a product of modern times, and it is at least certain that in the past the number of patients in such institutions did not bear even a remote relation to the actual number of insane in the population. According to the best information available only 20 of the present state hospitals for the insane in the United States were established prior to 1850; and an institution of this kind once founded appears generally to continue in existence, although the name and location may be changed. To this number 17 hospitals were added in the decade 1850 to 1859; 18, in the decade 1860 to 1869; 26, in the decade 1870 to 1879; and 33, in the decade 1880 to 1889. Table I shows, by states and territories, the growth of state hospitals for the insane from 1890 to 1904.

TABLE I.—NUMBER OF STATE HOSPITALS FOR THE INSANE OPENED BETWEEN 1890 AND 1904, FOR STATES AND TERRITORIES.

In each year of the period under consideration, except 1899, from one to five new state hospitals were opened. Table I does not take into account certain

new state hospitals replacing others that have been discontinued because of necessary changes of location. Meanwhile, as in all earlier periods, the capacity of the

old institutions has been greatly increased from time to time; and in the states where the system of county asylums obtains, notably in Iowa, New Jersey, and Wisconsin, new institutions of this description have been added and the facilities of the existing ones improved.

During the last decade the growth of private asylums for the insane has also been very marked. The number given in this report is more than double that returned in 1890. No institutions for the insane, except a very few small private institutions, refused to give information. Therefore, so far as all classes of institutions for the insane are concerned, the present enumeration is practically complete.

Insane in hospitals, 1880 to 1903.—Table II shows, by sex, the numbers and ratios of insane patients enumerated in hospitals in the United States at the dates of the last three censuses.

TABLE II.—Number and ratio of insane enumerated in hospitals on date of census, classified by sex: 1903, 1890, and 1880.

SEX.	INSANE ENUMERATED IN HOSPITALS.					
	Number.			Number per 100,000 of population.		
	December 31, 1903.	June 1, 1890.	June 1, 1880.	December 31, 1903.	June 1, 1890.	June 1, 1880.
Both sexes...	150,151	74,028	40,942	186.2	118.2	81.6
Males.....	78,523	38,330	20,635	119.0	119.5	80.9
Females.....	71,628	35,698	20,307	182.0	116.8	82.4

¹ Based on assumption that the sex distribution was the same on December 31, 1903, as on June 1, 1900.

At the end of the decade 1880 to 1890, the number of insane in hospitals had increased from 40,942 to 74,028, or 33,086, and the number of insane per 100,000 of population had risen from 81.6 to 118.2, or 36.6. In 1903, thirteen years later, the number of insane in hospitals had further increased by 76,123 patients, or more than the number found in 1890, and the number per 100,000 of population had increased by 68. These figures are, of course, for the most part merely illustrative of the larger utilization of hospitals for the treatment of the insane and not direct proof of a corresponding increase of insanity. In 1880 there were enumerated 51,017 insane persons outside of hospitals, as compared with 40,942 in these institutions. At the census of 1890 only 32,457 insane were discovered outside of hospitals, but the enumeration was confessedly less complete than the one preceding it, in which physicians had cooperated and helped to return a large number of insane whose existence otherwise might have been overlooked.

The enumerations prior to 1880 need not be considered, for the returns show upon their face impossible ratios of insane to population, unless one assumes what is contrary to all evidence, that from 1850 to

1870 the ratios remained nearly stationary, and then suddenly doubled.

All sections of the country have contributed to the phenomenal accumulation of insane in hospitals during recent years. This is fully shown in Table III, which gives the numbers of insane enumerated in hospitals and ratios to population for 1903 and 1890, as well as the rates of increase between the two periods.

Even more striking than the fact of the increased ratios of insane patients in hospitals in every state and territory is the unevenness with which the increase is distributed. However, the wide differences existing between the amounts by which the ratios of insane in hospitals have increased during the thirteen years should not be taken as a positive indication that insanity is making its appearance more rapidly in one state or territory than in another. It is true that the general conditions of life in one community are more conducive to the development of mental disorders than they are in another, but these differences probably arise from many causes, some of which are at present obscure.

How largely the increased ratios of insane in hospitals represent the accumulation of the sick in these establishments and not a proportionate growth of insanity becomes clearer when the figures for single states are contrasted. In the North Atlantic group, for instance, the increases in ratio of insane in hospitals since 1890 run from 26.1 in New Hampshire to 117.7 in New Jersey. In Vermont, which should naturally show conditions similar to New Hampshire, the ratio has increased by 110.4 since the last census.

In several instances the increase in ratio may be ascribed to particular causes. Thus, in Vermont the founding of a state hospital since the last enumeration helps to account for it; in New Jersey and Wisconsin the more complete census of county institutions results in apparently unfavorable ratios. But when all such exceptions have been made, the fact remains that the differences between ratios, and they are all in the direction of an increase, show primarily the extent to which hospitals are being utilized in the different communities, and not how many insane there are found in the population. The circumstance, for example, that New York and New Jersey each shows an increase in the ratio more than twice as large as that for Pennsylvania can not be taken as an indication of the relative rapidity with which insanity advances in these commonwealths.

There are doubtless more or less pronounced differences between states in the actual rate of insanity as distinguished from that reflected in the hospital returns. But just what these differences are can not be determined until a complete count of all the insane has been made without regard to present domicile; much less is it possible to distinguish the specific causes underlying these differences.

¹ Estimated.

The modern tendency toward a concentration of the insane in special institutions, which is becoming more and more marked, springs from a variety of conditions. As the management of the public hospitals and the care afforded patients have reached a higher standard, popular prejudice against these institutions has diminished. Yet until comparatively recent times the deep-rooted and often too-well founded aversion to hospitals for the insane was a sufficient factor to keep out of them all patients who could be cared for in some other manner. The popular conception of a hospital for the insane as a place of confinement for the abnormal is rapidly giving way to the modern

idea of a curative establishment for the sick. Wise legislation has accelerated the influx to hospitals in many places by segregating the criminal, incurable, and epileptic insane and the feeble-minded from the others, by providing better safeguards in the matter of commitments, and in a few instances by prohibiting the admission of insane persons to almshouses. That this movement toward hospitals for the insane has probably not reached its height may be inferred from the fact that commitments were relatively more frequent in the years comprised in the second half of the period 1890 to 1903 than in those included in the first half.

Growth or diminution of insanity.—Although the large accessions to the numbers of the insane in hospitals since the last census can in the main be accounted for on reasonable grounds, the question whether there has been an actual increase of insane in excess of the growth of population still remains. An approximate answer may be obtained by comparing the number of insane in hospitals in 1903 with the total number of insane in the population on the census dates 1890 and 1880. The comparisons are necessarily inexact, inasmuch as the enumeration of 1903 was limited by law to patients of institutions, while that of 1890 comprised no less than 32,457 insane outside of hospitals, and that of 1880, 51,017 such persons, or a considerably larger number than was found in hospitals. It should be remembered that the count in 1880 was participated in by physicians, who returned about 17 per cent of the total number of insane. The enumeration of 1890 proceeded without the aid of physicians and resulted in a decline in the number of insane per 100,000 of population, though hardly a real one, as may be gathered from the number of insane now shown in the public and private hospitals.

While it is probable that relatively a much smaller number of insane escape institutional restraint than some twenty years ago—otherwise the accumulation in hospitals would be inexplicable—it is indisputable that even at the present time there are thousands who, although recognizable as insane, have not been placed in the care of hospitals or other institutions for that class.

The recently published Census report on paupers in almshouses shows that in 1904 there were in almshouses 11,807 persons classed as insane, though doubtless this number includes not a few feeble-minded. Furthermore, in many states insane persons are still boarded in private families and therefore did not come under view in the present enumeration. In the aggregate this class of insane numbers several thousand. Finally, there are the insane who are maintained in their own homes, and do not come under the notice of state or local officials. The state board of lunacy of New York estimates their number in that state to be about 6,000. If perhaps not as numerous elsewhere, this class of insane nevertheless exists in every state.

To offer any estimate of the probable number of insane that would have been disclosed by an investigation which included those not in institutions in addition to those in hospitals on December 31, 1903, would be a mere guess. But it is certainly within the truth to say that there were as many on that date as were found outside of hospitals in 1890, or some 30,000. These considerations should be kept in mind when Table iv is read, which shows the number and ratio of insane enumerated in hospitals in 1903, and the number and ratio of total insane in 1890 and 1880,

together with the increase or decrease in ratio in 1903 as compared with 1890 and 1880, for states and territories.

In 1903 the number of insane in hospitals per 100,000 of population exceeded by 16.2 the ratio of all insane to population in 1890. Of the 49 states and territories entering into the enumeration, only 8 show decreased ratios at the present time as compared with 1890. The exceptions are: In the North Atlantic division, Maine and New Hampshire; in the South Atlantic, North Carolina; in the North Central, Ohio; and in the South Central, Kentucky, Tennessee, Alabama, and Arkansas. The figures in Table III show that in each of these 8 states the number of insane in hospitals has increased materially since 1890, and that higher ratios have resulted. But in 1890 the number of insane enumerated outside of hospitals exceeded the number found in these institutions in 4 out of the 8 states under consideration, namely, Maine, New Hampshire, Tennessee, and Arkansas; and in none of these 4 states has the accumulation of insane in hospitals since 1890 been so large that the number still outside of hospitals can be presumed to have been greatly diminished, much less exhausted. Therefore, so far as these 4 states are concerned, the reason for decreased ratios in 1903 on the basis of the comparisons in Table iv is quite clear. In North Carolina, Ohio, Kentucky, and Alabama the number of insane enumerated outside of hospitals at the Eleventh Census was also so large that, although there has been a marked increase in the hospital population since that time, it may be inferred that the decreased ratios do not indicate any actual decrease in insanity.

If the enumeration of 1903 had been made to include the insane outside of the hospital population it is evident that larger ratios than those for 1890 would probably have been shown for each state and territory. But even without the inclusion of this class a comparison of the ratio of insane in hospitals in 1903 with the ratio of total insane counted in 1890 shows that relatively the insane in the United States have increased faster than the population.

This conclusion is further substantiated by comparing the returns for 1903 with those for 1880. The completeness of the census of 1880 has not been questioned so far as the enumeration of the institutional population is concerned, and it was far more thorough than that of 1890 in regard to the insane outside of institutions, owing to the active participation of physicians in making returns of this class. A comparison of the ratios of insane in hospitals on December 31, 1903, with the ratios of total insane both in and outside of hospitals in 1880 shows that there was an increase in the ratio not only for the United States but for 31 out of the 47 states and territories included in the census of 1880; and that the increase in ratios was much larger in most of these 31 states than in the country as a whole.

1 Dakota territory in 1890.

On investigating the decrease in ratios shown by the remaining 16 states and territories during the twenty-three years, it should be borne in mind that the insane hospital population has practically doubled in each of these states since 1880, as an inspection of the figures in the first tabular statement on page 10 shows.

It should be noted that in those of the 16 states which show the greatest decreases in ratio since 1880, namely, Maine, New Hampshire, Vermont, North Carolina, Tennessee, Arkansas, and New Mexico, the total number of insane enumerated in that year was larger

than the number found in hospitals in 1903. But in the states just mentioned the general population has by no means been stationary. It is therefore apparent that in spite of the large increase in the hospital population of each of these states the decrease in ratio indicates that many of the insane are not provided for in institutions rather than that the number has decreased. Or, to put it differently, it is absolutely certain that if in the states in question the insane outside of the hospitals had been enumerated, a comparison of the figures for 1880 and 1903 would show increased ratios in all cases.

STATE OR TERRITORY.	INSANE ENUMERATED IN HOSPITALS.

Western division:		
New Mexico.....	113	(²)

¹ Hospital population not enumerated.² No public hospital in 1880.

Similarly, a consideration of all the facts for the remaining 9 states shows that the inference may be drawn that the apparently decreased ratios for 1903, as compared with 1880, are due to the continued existence in these communities of many insane who are not provided for in institutions, and therefore did not enter into the census of 1903, and to the exceptionally complete returns for this class in 1880.

From whatever point the matter is viewed, the census returns since 1880 permit but one conclusion, namely, that the rate of increase is greater for the insane in the United States than it is for the general population. It is impossible, however, to determine the difference between these rates until provision is again made for an enumeration of the insane, no matter whether found in or outside of institutions. Although the hospital returns tell a one-sided story, they invariably point to an increase in the prevalence of insanity.

INSANE IN FOREIGN COUNTRIES.

The latest available statistics of most countries outside of the United States point to steadily advancing ratios of the insane. It is difficult, however, to establish conclusively whether the advance in ratios is due to an actual increase in insanity, to a greater accuracy in the enumeration, or to enlarged and improved institutional facilities for the care of the insane, which always tend to an increased use of hospitals by persons who are not compelled to seek public aid. The weight of authoritative opinion appears to support the view of an actual increase in insanity. At all events the ratios of the insane, whether measured solely by the number in hospitals or with the addition of those found outside of institutions, have increased during recent years in all countries for which reliable returns are at hand.

The following tabular statement shows the numbers

and ratios of insane for a number of European countries and for Canada:

COUNTRY.	Year.	INSANE IN HOSPITALS.		TOTAL INSANE.	
		Number.	Number per 100,000 of population.	Number.	Number per 100,000 of population.
England and Wales.....	1903	113,964	340.1		
Scotland.....	1903	16,658	363.7		
Ireland.....	1903	22,138	490.9		
Canada.....	1901	12,819	238.6	16,495	307.0
France.....	1904	69,190	177.5		
Germany.....	1903	108,004	191.6		
Italy.....	1899	34,802	109.2		
Austria.....	1901	14,895	57.0	30,747	117.5
Hungary.....	1902	2,716	14.1	17,117	88.8
Netherlands.....	1903	8,958	167.5		
Switzerland.....	1901	7,434	224.2		
Norway.....	1902	1,833	80.5	5,397	228.4
Sweden.....	1903	5,093	97.3	8,093	154.9
Denmark.....	1901	3,438	140.3	4,197	171.3

The returns for England and Wales are of all "notified lunatics." The figures for Ireland do not include the insane in private dwellings except a few single chancery cases. In the number shown for Scotland are counted "inmates of training schools and the lunatic department of the general prison."

The 12,819 insane in Canadian hospitals represent the total treated during the year in public hospitals. The number present on a given date would necessarily be smaller and show a more favorable ratio.

The statistics for France are of inmates of public and private asylums.

There has been no official enumeration of the insane in the German Empire since 1871. The figures given were compiled by Dr. Max Hackl; they are based upon hospital returns and are considered authoritative, though rather conservative.

There has been no general census of the insane in Italy since 1871. In that year the total number of insane persons returned for continental and insular Italy was 44,102. The figures given in the table were compiled by Doctors Tamburini and Fornasari di Verce in "Rivista Sperimentale di Freniatria," 1900.

Of the total number of known insane in Austria January 1, 1901, 46.7 per cent were in asylums, 11.8 per cent were sheltered in other eleemosynary institutions, and 41.5 per cent were in private care.

In Hungary also but a small fraction of the insane were provided for in public institutions.

The figures for the Netherlands and Switzerland include inmates of public and private asylums.

The striking difference between Norway and Sweden in regard to ratios of the total number of insane appears to be due to the fact that the total given for Norway (5,397) was obtained by an actual enumeration, while the total for Sweden (8,093) represents only the number inspected by the authorities whose duty it is to visit known insane persons in their homes. In the

year 1903 admissions to the public hospitals of Sweden had to be denied for lack of space in 1,698 cases.

INSANE IN HOSPITALS ON DECEMBER 31, 1903.

When it is borne in mind that the ratios indicate how far the insane are cared for in the public and private asylums of the different states, and not necessarily the prevalence of insanity in any community, the figures for 1903, given in Table iv, disclose first of all an extraordinary range in the extent to which hospital facilities are either utilized or provided. Disregarding the District of Columbia, where the presence of a large Government hospital causes a ratio that bears little relation to the actual conditions in the District, it is seen that the ratios elsewhere vary from 472.4 in Nevada to 48.4 in Arkansas. The population of Nevada was smaller in 1903 than in 1890, while the number of insane had increased; these are probably the chief reasons for the abnormal ratio accredited to that state.

Extreme variations in ratios have little significance, of course, so long as they relate to states with far different general conditions. Marked divergences are observed, however, not only between state groups but between contiguous states that are as one in respect to the composition and distribution of the population, climate, pursuits, and other facts which are presumed to have a bearing upon the origin of insanity.

As in all preceding censuses, the states of the North Atlantic division show the largest ratio of insane in hospitals. This is what should be expected, as this division represents the oldest civilization, the greatest congested centers, and the most mixed population.

As compared with that for the North Central states, where hospital management is equally capable and facilities for care equally abundant, the higher ratio shown for the North Atlantic states may be taken as indicative of an actually higher rate of insanity. It also accords with known facts to find a lower ratio of insane to population in the South Atlantic and South Central state groups. But that the number of insane per 100,000 of population should be only 16.1 less in the Western division than in the North Atlantic states seems out of harmony with the generally accepted view in regard to conditions which are supposed to govern more or less the rate of insanity, and awaits a further explanation than may lie in the fact of a more liberal use of asylums in the West, or the lack of suitable institutions for the care of all the insane in the East.

In one sense the ratios of the South Atlantic and South Central states are farthest apart, for in these groups there is no diversity of conditions sufficient to produce a ratio of 150 in one as against 91.8 in the other. In these divisions the difference appears to be determined by the extent to which hospital facilities are provided and used.

The insufficiency for purposes of comparison of ratios of insane to population based solely upon the numbers found in hospitals is brought out most clearly

by contrasting the ratios of insane in states within the same geographic group. The ratio of insane in Vermont, for example, is shown to be more than twice as large as in the adjoining state of New Hampshire, although both states have a population of the same stock, living and moving in the same sort of environment. Vermont, however, has, so far as the Census records show, always provided for a larger proportion of her insane in hospitals. Moreover, within the borders of Vermont there is a large private establishment containing many patients who are nonresidents of the state.

The hospital returns show that the number of insane per 100,000 of population is greater by 166.4 in New York than in Pennsylvania, but probably no one would dare assert that these figures represent the actual difference in the prevalence of insanity in these two states. While there may be reason to believe that insanity occurs with relatively greater frequency in New York, the marked difference in ratios as revealed in the hospital statistics merely points to the more complete registration of the insane in New York; that is, to the fact that they are more generally provided for in special institutions by the proper authorities. It is known, for instance, that in 1904 the number of insane enumerated among the inmates of almshouses was 1,888 in Pennsylvania and only 304 in New York.

Throughout the other state groups the variation in ratios between states shows not so much the difference in the relative number of insane as the extent to which they have been segregated from the rest of the population. Among states which pursue most nearly the same policy in the care of the insane—and of this the North Central states furnish perhaps the best example—the ratios are the closest together. Yet even in this group high ratios are encountered that might easily lead to mistaken inferences unless such matters as the practical exclusion of the insane from almshouses, ampler accommodations in asylums, etc., are considered.

The order of the states in respect to the number of insane per 100,000 of population, as indicated in Table iv, should be read in the light of the explanations just given. In many cases the high rank given some states, for instance, Massachusetts, New York, Connecticut, New Jersey, California, etc., probably approximates actual conditions; but to find Arkansas at the very bottom of the list is merely evidence of how few of her insane are housed in hospitals, for it is known that even thirteen years ago there were many more insane in the state than are now provided for in this manner.

MOVEMENT OF POPULATION OF HOSPITALS FOR THE INSANE DURING 1904.

Table v, based on Table 2 (page 80), shows, by color and sex, the number of insane in hospitals on December 31, 1903, and on January 1, 1905, with the increase or decrease in number between those dates, for states and territories.

INSANE IN HOSPITALS.

During the twelve months covered by the table 49,622 persons were committed to hospitals as insane, of whom 27,389 were males and 22,233 females. In the same period the discharges, deaths, and transfers numbered 41,733. The proportion of the sexes was about the same for the persons discharged as for the persons admitted.

On January 1, 1905, the population of all hospitals was larger by 7,889 than on December 31, 1903; this number, therefore, represents the magnitude of the annual increment of insane in hospitals at the present time. The growth in number for the year was greatest

in the North Atlantic division, with the North Central states second and the Western third. The actual additions to the number of insane in hospitals during a stated period, whether regarded by geographic divisions or by individual states, are liable to be misunderstood, unless studied in connection with admissions and with discharges, deaths, and transfers. It does not follow that the number of admissions is reflected accurately in the increase at the end of the period under observation. An equal number of admissions for twelve months in two states may result in a very unequal increase in numbers at the end of the year.

All depends upon the policy pursued in making discharges and transfers and upon the death rate. Thus, in the North Central division, the admissions or commitments during 1904 exceeded those for the North Atlantic states by 1,663; yet at the close of the year the first-mentioned group showed an increase in patients less by 145 than the second. The Massachusetts hospitals return 1,001 admissions for 1904, as compared with 6,630 in New York. Nevertheless, on January 1, 1905, the actual increase in hospitals was represented by 938 patients in Massachusetts and by only 843 in New York. Similar contrasts are furnished by the figures for many states.

The details in regard to admissions and to discharges, deaths, and transfers, are exhibited in Tables 1 and 2 (pages 79 and 80), in which the movement of the insane population in hospitals is shown for states and territories, and in Table 3 (page 82), where it is shown for each hospital. For the present it is enough to emphasize the fact that the increase in the hospital population during a year is not governed entirely by the number of admissions. The variations in the rate of increase, which often appear inconsistent with the number of admissions, are much less affected by the death rate in hospitals, which is to be discussed later, and the customs in regard to the transfer of patients to other institutions, than by the policies observed in regard to discharges. Further light is thrown upon the movement of population in hospitals by the figures in Table VI, which gives the percentages of admissions and of discharges, deaths, and transfers to total insane in hospitals at some time during 1904.

Although the percentages of admissions to total population in hospitals do not permit exact inferences in regard to the relative growth of insanity in the various states or groups of states, it is interesting to note that the range of variation in the percentages of admissions for the main geographic divisions is only 4.4, the highest percentage, 27.1, being shown by the North Central and the lowest, 22.7, by the South Central states. The extreme percentages of admissions are represented by 41.5 for New Hampshire and 11.8 for Arkansas. The differences within state groups are considerable. The percentages vary in the North Atlantic division from 20.2 in New York to 41.5 in New Hampshire; in the South Atlantic (exclusive of the District of Columbia), from 22.4 in Virginia to 32 in South Carolina; in the North Central, from 18.2 in South Dakota to 30.6 in Illinois; in the South Central, from 11.8 in Arkansas to 36.4 in Oklahoma; and in the Western, from 13.4 in Nevada to 40 in Colorado. In any state, however, special factors such as an addition to the existing hospital facilities, transfers of insane from prisons, almshouses, etc., may materially influence the rate of admissions to hospitals. Conclusions concerning the relative increase or decrease of insanity in different states, based upon the rate of admissions for a single year, may, therefore, be quite

erroneous, although they may be fairly correct if based upon a comparison of such rates for a series of years.

TABLE VI.—Number and per cent of admissions and of discharges, deaths, and transfers among the insane in hospitals, for states and territories: 1904.

It has already been intimated that the percentage of discharges, reflects the policy of the hospital authorities. Not only may the disposition to pronounce patients fit to return to society be greater in some places than in others, but more frequent discharges may be necessary to relieve congestion. Everywhere there is a cry of overcrowding in the public hospitals. Again, some states have a system of allowing patients to leave the hospitals on parole, which means that they can be taken back without a new commitment. Where this

system does not obtain, the authorities are naturally more chary in discharging their wards. Finally, where the hospital is mainly a place of detention for the chronic insane, and this appears to be the case in some states with a particularly low ratio of insane to population, the percentage of discharges is of necessity relatively small.

The percentages of admissions exceed the percentages of discharges, deaths, and transfers in all states and territories except Vermont, Nevada, Oklahoma, and New Mexico. For Vermont and Nevada there is a slightly greater number of discharges, deaths, and transfers than of admissions; while for Oklahoma and New Mexico the number of each is the same. The greatest differences between the percentages of admissions and of discharges, deaths, and transfers are found in Washington (16), Arizona (13.6), New Hampshire (13.4), Colorado (12.5), and Wyoming (8.3). In a few states the discharges, deaths, and transfers are so frequent as to reduce the increase through admissions almost to the vanishing point, notwithstanding the fact that these states have numerous admissions. Thus, for instance, Wisconsin shows a net gain of only 26 patients during 1904, although the admissions numbered 2,094, which is many more than occurred in neighboring states of approximately the same size. The three states besides Wisconsin which show an almost imperceptible gain in the number of insane in hospitals are Maryland, Louisiana, and Arkansas; but in each of the last two states the proportion of both admissions and discharges, deaths, and transfers to the total population is very small, and therefore not especially significant.

The movement of population in the private hospitals for the insane is not subject to quite the same conditions as the movement in the public hospitals. With few exceptions, the first mentioned are not endowed institutions, but are established for private profit, and moreover depend only in part upon the number of insane patients admitted. Most of the

private hospitals take only certain classes of insane. All told, the population of the private institutions, 5,498, formed only an insignificant fraction of the total insane numbered in hospitals on December 31, 1903, for the United States. The greater part of this number was distributed among these states: Colorado, 156; Connecticut, 327; Iowa, 462; Louisiana, 248; Maryland, 762; Massachusetts, 238; Michigan, 231; Missouri, 285; New York, 990; Ohio, 142; Pennsylvania, 720; Rhode Island, 170; Vermont, 370; and Wisconsin, 106. Each of the remaining 10 states showing returns for private hospitals had less than 100 patients.

The admissions to private institutions in 1904 numbered 4,710 and the discharges 4,671, thus leaving an increase for the year of 39 patients. The movement of population is, on the whole, more rapid in the private institutions than in the public. Private hospitals are primarily designed for the reception of patients who can be cured, and not of those who are hopelessly insane; whereas public institutions must of necessity receive both classes, and thus contain a relatively larger number of patients who must remain in confinement until removed by death.

Although it seems impossible to determine definitely whether insanity is increasing or not from the percentages of admissions and discharges, deaths, and transfers for a single year, the numerical excess of admissions over discharges, deaths, and transfers during 1904, when compared with the increase in number of insane in hospitals during the past thirteen years, indicates that the accumulation of insane in hospitals is probably progressing at least as rapidly as ever before.

ANALYSIS OF DATA, 1904.

Table VII shows the numerical distribution of the insane enumerated in hospitals on December 31, 1903, and of those admitted to hospitals during 1904, by sex, color, nativity, and race, for main geographic divisions.

ANALYSIS OF DATA.

15

¹ Having one parent native and the other foreign, or one parent unknown and the other either native or foreign.

An inspection of the figures in Table VII makes it evident that both the aggregate insane enumerated in hospitals on December 31, 1903, and those admitted to hospitals during 1904 are very unevenly distributed among the main geographic divisions. Whether this

distribution is in accordance with that of the general population is shown by the figures in the following tabular statement, as the distribution of the general population has probably changed but little since 1900:

DIVISION.	PER CENT DISTRIBUTION OF—		
	General population, 1900.	Insane enumerated in hospitals, December 31, 1903.	Insane admitted to hospitals during 1904.
Continental United States.....	100.0	100.0	100.0
North Atlantic.....	27.7	38.2	35.3
South Atlantic.....	13.7	11.0	10.8
North Central.....	34.7	34.4	38.7
South Central.....	18.5	9.3	8.2
Western.....	5.4	7.1	7.0

These figures show that a relatively larger number of the insane enumerated in hospitals on December 31, 1903, than of the general population in 1900 are found in the North Atlantic and Western divisions, while in the North Central division the relative number of each class is about the same. In each of these three divisions the percentage for the insane admitted to hospitals during 1904 is greater than it is for the general population in 1900. In this connection it is interesting to recall that the per cent distribution, by main geographic divisions, of paupers enumerated in almshouses on December 31, 1903, is rather similar to that of the insane enumerated in hospitals on the same date. There is, however, no resemblance between the corresponding figures for those of the two classes admitted during 1904, nor should any similarity between the percentages be expected, in view of the fact that this class of paupers is composed largely of migrants who leave the almshouses when spring opens, while the insane admitted to hospitals generally remain there indefinitely or until cured. Whether any definite relations exist between the prevalence of pauperism and the prevalence of insanity in a community has not been clearly established. It is held generally, however, that the two evils are connected closely, for most insane patients in hospitals are drawn from the ranks of society living under hard economic conditions. As the greatest amount of poverty is known to exist in the North Atlantic states, the statistics for the insane in hospitals may be taken as a probable indication that insanity is greatest in the same group of states. It has been shown that the low percentages of pauperism in almshouses in the South Atlantic and South Central states can be regarded, not as evidence of the existence of paupers in such small numbers, but rather as proof that the institutional provisions are inadequate. The same factor, together with a less general disposition to entrust the insane to institutional care, doubtless determines more or less the percentages of insanity in hospitals in these two sections of the country, particularly in the South Central division. No other theory offers so satisfactory an explanation of the low ratios of insane in hospitals to population in these southern geographic divisions, or of the difference, as between the two, in favor of the South Central states.

The presence in the general population of an unusual proportion of adults tends toward a higher percentage of insanity, for the malady rarely appears in youth.

The Western division would doubtless show lower ratios of insane in hospitals but for the large proportion of adults in the population.

To complete the view of the distribution of the insane in hospitals in the United States, as a whole, the aggregate enumerated on December 31, 1903, and the aggregate admitted during 1904 are shown in Table VIII, by states and territories, together with the rank of each state in accordance with those numbers. As already noted, the indicated rank of a state has for the most part little relation to the actual prevalence of insanity, but is rather illustrative of the extent to which hospitals are provided and used.

TABLE VIII.—Rank of each state and territory in number of insane enumerated in hospitals, December 31, 1903; in number admitted to hospitals during 1904; and in general population, 1900.

Sex.—As shown in Table VII, there were on December 31, 1903, among the insane patients in hospitals 78,523 males and 71,628 females. Of the admissions during 1904, 27,389 were males and 22,233 females. The figures from previous censuses corresponding to those for 1903 are: 1890, 38,330 males and 35,698 females; 1880, 20,635 males and 20,307 females.

The following tabular statement gives the per cent distribution, by sex, of the insane enumerated in hospitals at the censuses of 1880, 1890, and 1903, and also that of the general population enumerated at the censuses of 1880, 1890, and 1900:

SEX.	PER CENT DISTRIBUTION OF—					
	General population.			Insane enumerated in hospitals.		
	1900	1890	1880	December 31, 1903.	June 1, 1890.	June 1, 1880.
	Both sexes...	Both sexes...	Both sexes...	Both sexes...	Both sexes...	Both sexes...
Both sexes...	100.0	100.0	100.0	100.0	100.0	100.0
Males.....	51.1	51.2	50.9	52.3	51.8	50.4
Females.....	48.9	48.8	49.1	47.7	48.2	49.6

The proportion of males is increasing faster in the insane population of hospitals than in the general population, while the reverse is true of the females.

This condition taken in connection with the ratios of insane in hospitals to the general population, given in Table II, suggests that the tendency toward insanity in the United States as a whole is increasing, if at all, faster among males than among females. The impossibility of obtaining data concerning other factors, such as the proportions of the sexes among the insane outside of hospitals, precludes, however, any definite conclusion with respect to the relative tendency toward insanity in the sexes.

The per cent distribution, by sex, of the insane enumerated in hospitals on December 31, 1903, and of those admitted to hospitals during 1904 is shown in the Table IX, for main geographic divisions.

TABLE IX.—Per cent distribution, by sex, of insane enumerated in hospitals, December 31, 1903, and of those admitted to hospitals during 1904, for main geographic divisions.

DIVISION.	INSANE IN HOSPITALS: 1904.			
	Enumerated, December 31, 1903.		Admitted during 1904.	
	Per cent male.	Per cent female.	Per cent male.	Per cent female.
Continental United States.....	52.3	47.7	55.2	44.8
North Atlantic.....	48.1	50.9	51.0	49.0
South Atlantic.....	52.5	47.5	54.0	46.0
North Central.....	53.5	46.5	57.5	42.5
South Central.....	51.2	48.8	53.6	46.4
Western.....	64.8	35.2	67.4	32.6

An inspection of the figures in Table IX for the insane enumerated in hospitals on December 31, 1903, shows that in every division except the North Atlantic the proportion of males is greater than that of females. Whether the percentage of males among the insane in hospitals is increasing in the different divisions is shown by a comparison with the figures for 1890, given in the following tabular statement:

DIVISION.	GENERAL POPULATION.				INSANE ENUMERATED IN HOSPITALS, JUNE 1, 1890.	
	1900		1890		Per cent male.	Per cent female.
	Per cent male.	Per cent female.	Per cent male.	Per cent female.	Per cent male.	Per cent female.
Continental United States.....	51.1	48.9	51.2	48.8	51.8	48.2
North Atlantic.....	50.0	50.0	49.9	50.1	48.0	52.0
South Atlantic.....	50.0	50.0	49.9	50.1	53.7	46.3
North Central.....	51.6	48.4	51.9	48.1	52.7	47.3
South Central.....	51.0	49.0	51.0	49.0	51.1	48.9
Western.....	56.2	43.8	58.9	41.1	66.7	33.3

The percentage of males among the insane in hospitals is increasing in every division except the South Atlantic and the Western. In the Western states the decrease in the proportion of males is not so great in the insane population of hospitals as in the general population. In the South Atlantic group the decrease in the proportion of males among the insane in hospitals is confined, for the most part, to states in which the proportion of males in the general population has also decreased.

The proportion of males among the insane admitted to hospitals during 1904 is greater than it is among the insane enumerated in hospitals on December 31, 1903, in every division.

With respect to the different states it is impossible to determine accurately the ratio of insane to population for the males and for the females. The figures for sex, given in Table I, show that, exclusive of the District of Columbia, there are only 10 states in which the difference between the proportions of the sexes is not in the same direction for the insane in hospitals on December 31, 1903, as for the general population in 1900; and in most of these states the number of insane per 100,000 of population is comparatively small. The proportions of the sexes in the insane population of hospitals on December 31, 1903, and in the general population in 1900 indicate that the ratio of insane in hospitals to population is probably greater for the males than for the females in most of the states and territories.

The per cent distribution, by sex, of the insane enumerated in hospitals on December 31, 1903, and of those admitted to hospitals during 1904, classified by color, nativity, and race, is given in Table X.

INSANE IN HOSPITALS.

TABLE X.—Per cent distribution, by sex, of insane enumerated in hospitals, December 31, 1903, and of those admitted to hospitals during 1904, classified by color, nativity, and race.

¹ Having one parent native and the other foreign, or one parent unknown and the other either native or foreign.

² Per cent not shown where base is less than 100.

For the insane enumerated in hospitals on December 31, 1903, the figures in Table x show that the percentage of males among the native white insane of native parentage is less than that among the native white insane of foreign parentage. The foreign born white insane have a smaller proportion male than any other race or nativity class except the native white of unknown parentage and the negro. When it is recalled that 54 per cent of the total number of foreign born whites in the United States in 1900 were males, the 51.5 per cent male among the insane of this class indicates that insanity is more likely to occur in the case of a foreign born white female than of a foreign born white male. In so far as one can judge from hospital returns for negroes, there are more insane males than females of this race, which is particularly significant, as in the general negro population only 49.7 per cent are males.

The figures for admissions during 1904 show that the males exceed the females in every race and nativity class. Although this fact was also true of the insane in hospitals on December 31, 1903, the excess of males was not so marked. The data for admissions, however, are too meager to permit safe generalizations.

Color.—As shown in Table vii, there were 140,312 white insane in hospitals on December 31, 1903, and 9,839 colored (including 329 Mongolians and 58 Indians); while in 1904 there were admitted to hospitals 46,300 white insane and 3,322 colored (including 78 Mongolians and 27 Indians).

Since under the term "colored" but few Mongolians and Indians are here included, the title may be considered as practically synonymous with negro unless special reference is made to the other two classes.

Table xi gives the per cent distribution, by color, of the insane enumerated in hospitals on December 31, 1903, and of those admitted to hospitals in 1904, for states and territories. The absolute numbers, from which these figures are derived, are given in Table 2.

TABLE XI.—Per cent distribution, by color, of insane enumerated in hospitals, December 31, 1903, and of those admitted to hospitals during 1904, for states and territories.

¹ Per cent not shown where base is less than 100.

The per cent distribution of the general population in 1900 by color is shown in the following tabular statement for the main geographic divisions:

DIVISION.	GENERAL POPULATION: 1900.	
	Per cent white.	Per cent colored.
Continental United States.....	87.9	12.1
North Atlantic.....	98.1	1.9
South Atlantic.....	64.2	35.8
North Central.....	97.9	2.1
South Central.....	69.7	30.3
Western.....	94.7	5.3

A comparison of these figures and of those in Table XI for the insane enumerated in hospitals on December 31, 1903, makes it evident that neither in continental United States as a whole, nor in any geographic division, except the North Atlantic and the North Central, are the colored represented among the insane in hospitals in proportion to their numbers in the population. A similar fact was brought out for the total insane in the report on the insane, etc., for 1890 (page 10), as follows: "The ratio of the colored insane to colored population is more than twice as great in the northern part of the country as in the southern * * * and a considerable part of this difference between the North and South is probably due to the fact that there is a much greater proportion of adults, of ages liable to insanity, among the colored population in the North than is the case in the South."

In so far as one may judge from a comparison of the figures for the distribution, by color, of the insane in hospitals in 1903 and of the general population in 1900 the same differences still exist. In all states of the North Atlantic division, except Vermont and New Hampshire, is the percentage of colored among the insane in hospitals larger than the percentage of colored in the general population. The states of the North Central division, except Wisconsin, Minnesota, Missouri, North Dakota, and South Dakota, likewise show a higher percentage of colored among the insane in hospitals than among the general population. Missouri is in the same class with the Southern states in respect to the proportion that the percentage of colored among the insane in hospitals holds to the percentage of colored in the general population. The unexpected percentage of colored among the insane in South Dakota, with its comparatively large Indian population, is due to the 20 Indians found in a special hospital in 1903. In Wisconsin, Minnesota, and North Dakota the colored population is composed largely of Indians, very few of whom, as a rule, are found in asylums.

The largest representation of colored is found in the South Atlantic and South Central states, and in each of those states, except Delaware, West Virginia, and Kentucky, the percentages which the colored constitute of the insane in hospitals are much smaller than the percentages which negroes form of the general population. In Delaware 22.1 per cent of the insane in hospitals on December 31, 1903, were colored, yet the negroes constituted but 16.6 per cent of the total population at the last census. In Kentucky, with 13.3 per

cent negroes in the population, 15.6 per cent of the insane in hospitals were colored. On the other hand, in Alabama and Mississippi, for instance, with respectively 45.3 and 58.7 per cent colored in their population in 1900, the percentages of colored among the insane in hospitals in 1903 were only 27.9 for Alabama and 37.4 for Mississippi. It is unthinkable that the actual ratio of insane to population among the colored of Delaware or Kentucky should so greatly exceed that of Alabama or Mississippi, or that it should be relatively very much higher than in any of the other Southern states. In fact, the available statistics do not show the relative frequency with which insanity occurs among the negroes, but merely the extent to which they are cared for in hospitals. The returns from Delaware, West Virginia, Kentucky, and a number of Northern states would seem, however, to point to a ratio of insane to population among negroes which equals if it does not surpass that among the whites.

In the Western division the colored among the insane in hospitals includes 108 negroes, 291 Mongolians, and 13 Indians. Of the Mongolian insane, 218 were found in California, 33 in Oregon, 10 in Nevada, etc. (Table 4, page 96). The figures are too small, however, to permit any conclusions concerning the ratio of insanity in these nationalities.

The percentage of colored among the insane admitted to hospitals in 1904 is slightly higher than the percentage of colored among the insane in hospitals on the given date of 1903. In only 15 of the states and territories, exclusive of the District of Columbia, is the difference between the percentages of colored among the insane enumerated in hospitals on December 31, 1903, and among those admitted to hospitals during 1904 greater than 1. The amount of this difference, increase (+) or decrease (-), is as follows: South Carolina, +7.2; Florida, +5.8; Tennessee, +5.5; Oklahoma, +5.4; South Dakota, +4.8; Colorado, +4.3; Mississippi, +3.1; Virginia, +2.3; Washington, +1.7; Kansas, +1.6; Montana, -1.5; Idaho, -2; Texas, -6.6; North Carolina, -6.8; and Louisiana, -8.5. The policy of the authorities with regard to the committing of the colored insane to institutions is probably largely responsible for the differences noted. How little relation the percentage of colored among admissions to insane hospitals bears to the actual ratio of insanity among negroes in some states may be gathered from the fact that in Kansas, with a percentage of 3.7 colored in the general population in 1900, the percentage of colored insane among admissions to hospitals in 1904 was 5.5, while in Texas, where the negroes formed 20.4 per cent of the general population in 1900, the percentage of colored among the insane admitted to hospitals in 1904 was only 5.7. In this instance it is obvious that the proportion of colored among the insane registered in a year depends upon the provisions made for them in public institutions by the authorities.

Nativity of white insane.—According to Table VII, of the 140,312 white insane in hospitals on December 31, 1903, 90,297 were natives of the United States, 47,078 foreign born, and 2,937 of unknown nativity. Of the 46,300 white insane admitted to hospitals during 1904 31,577 were native, 13,405 foreign born, and 1,318 of unknown nativity. The details for states and territories are given in Tables 4 and 5 (pages 96 and 98). Table XII shows the percentages native and foreign born among the white insane of known nativity in hospitals on December 31, 1903, and among those admitted during 1904, for states and territories.

TABLE XII.—Per cent distribution, by nativity, of white insane of known nativity enumerated in hospitals, December 31, 1903, and of those admitted to hospitals during 1904, for states and territories.

¹ Per cent not shown where base is less than 100.

A per cent distribution by nativity of the white insane of known nativity in hospitals shows very little unless it is compared with a similar distribution of the general white population. A method preferable, however, to such a comparison would have been to show the ratio of insane to general population for each nativity class; but unfortunately general statistics were not collected for 1903, and therefore it is necessary to compare the per cent distribution of the insane enumerated in hospitals on December 31, 1903, and of those admitted during 1904 with a similar distribution of the general population for 1900.

If the general population of all ages be taken, the bases for the comparison will not be equable, for several reasons. The insane in hospitals are all at least 10 years of age. The immigrants are, for the most part, between 15 and 40 years of age. The number of children under 10 years of age is extremely small among the white immigrants as compared with native whites. Under these conditions a comparison of the proportions of each nativity class in the white insane population of known nativity in hospitals with the corresponding proportions in the general population of all ages would be manifestly unfair, for the inclusion of children under 10 years of age would so increase the proportion of natives in the general population that it would seem as if insanity were more prevalent among the foreign born as compared with the native whites than is actually the case. Therefore children under 10 years of age are omitted, and the figures given for general population in Table XII refer only to those at least 10 years of age. Even with this modification the figures are on the whole more unfavorable to the foreign born white than the real facts warrant, as no account could be taken of the large immigration between 1900 and 1903. It is not thought, however, that this omission will seriously affect the conclusions drawn.

Of the whites at least 10 years of age in the general population of the United States in 1900, 80.5 per cent were native and 19.5 were foreign born; while of the white insane of known nativity enumerated in hospitals on December 31, 1903, 65.7 per cent were native and 34.3 were foreign born. Relatively, therefore, the insane are more numerous among the foreign born whites than among the native.

The same conditions prevail in each geographic division, as can be seen easily in the following tabular statement:

DIVISION.	GENERAL WHITE POPULATION 10 YEARS OF AGE AND OVER: 1900.		WHITE INSANE OF KNOWN NATIVITY ENUMERATED IN HOSPITALS, DECEMBER 31, 1903.	
	Per cent native.	Per cent foreign born.	Per cent native.	Per cent foreign born.
Continental United States.....	80.5	19.5	65.7	34.3
North Atlantic.....	71.7	28.3	59.6	40.4
South Atlantic.....	95.9	4.1	87.5	12.5
North Central.....	79.4	20.6	64.5	35.5
South Central.....	95.1	4.9	91.4	8.6
Western.....	75.4	24.6	51.0	49.0

Not for all states, however, does a comparison of the figures for the general white population at least 10 years of age with those for white insane show that the foreign born contribute a relatively greater number of insane to hospitals than the native whites. The matter is one largely determined by the nationalities which make up the foreign born population. Thus in Maine and New Hampshire, with a foreign population chiefly composed of Canadians, who, as will be shown later, exhibit less insanity than most immigrant races, the percentages of insane are relatively higher among the native whites than among the foreign born. But the reverse is true, for example, of Massachusetts, Connecticut, New York, New Jersey, and Pennsylvania, which have large contingents of Irish and Germans, and to some extent of Scandinavians, who of all white foreign born appear to be the most prone to insanity.

In the states of the South Atlantic division where the foreign born elements are of some magnitude, they contribute a disproportionately large share of the insane—for instance, in Delaware, Maryland, and Florida. This fact also applies to Louisiana and Texas of the South Central division. Where the foreign born constitute only a very small per cent of the total white at least 10 years of age, as is the case in all of the South Atlantic and South Central states not mentioned above, no reasonable inferences can be drawn from the percentages of foreign born among the white insane.

For each state of the North Central division the figures show that the foreign born whites contribute relatively more to the white insane in hospitals than to the general white population. In these states the Germans, Irish, and Scandinavians are important nationalities among the foreign born whites, and, as will be shown later, they all send relatively large numbers of insane to hospitals.

In the Western division, also, every state has relatively more foreign born among the white insane in hospitals than among the general white population.

It is not necessary to analyze in the same way the percentages of native and foreign born among the white insane admitted to hospitals during 1904. Although the percentages of native white insane are uniformly a little higher than on December 31, 1903, New Hampshire, Rhode Island, and Utah being the only exceptions, it is evident that the foreign born continue to furnish much more than their proportionate share of insane. It should be remembered, however, that the distinction between native and foreign is rapidly losing significance as a means of gauging the real elements of population from which the insane are recruited most largely. With each year the number of native insane of foreign parentage becomes more and more conspicuous in the total number of insane of native birth.

Parentage of native white insane.—In Table VII it was shown that out of 90,297 native white insane persons in hospitals in 1903 there were 50,435 of native parentage, 14,975 of foreign parentage, 3,950 of mixed parent-

age, and 20,937 whose parentage was not ascertained. The corresponding figures for white insane admitted to hospitals in 1904 show 19,198 of native, 5,673 of foreign, and 1,760 of mixed parentage, with 4,946 whose parentage remains unknown. Only those of known parentage are considered in Table XIII, which gives the per cent distribution, by nativity of parents, of the native white insane enumerated in hospitals on December 31, 1903, and of those admitted to hospitals during 1904, for states and territories.

TABLE XIII.—Per cent distribution, by nativity of parents, of native white insane of known parentage enumerated in hospitals, December 31, 1903, and of those admitted to hospitals during 1904, for states and territories.

¹ Having one parent native and the other foreign, or one parent unknown and the other either native or foreign.

² Per cent not shown where base is less than 100.

When 34.3 per cent of the white insane of known nativity enumerated in hospitals on December 31, 1903, are foreign born—a proportion much greater than that which the foreign born constituted of the general white population of 1900—it might naturally be expected that a similar condition would be found among the native whites of foreign parentage. Such is not the case, however, for although the native white with both parents foreign born contributed 10.7 per cent of the white insane population of 1903, they formed 15.9 per cent of the general white population of 1900. The native white of mixed parentage, who are usually regarded as of foreign parentage, formed 2.8 per cent of the white insane and 7.5 per cent of the general white population. Thus the number of insane among native whites of foreign parentage, including those of mixed parentage, is relatively smaller than among foreign born whites.

The native whites of foreign parentage also appear to advantage when contrasted with the native whites of native parentage. The native whites of foreign parentage constituted 27.7 per cent of the total native white in the general population of 1900, while those of foreign parentage, including mixed parentage, formed 27.3 per cent of the total native white insane of known parentage enumerated in hospitals on December 31, 1903. The native whites of native parentage, on the other hand, constituted 72.3 per cent of the white population and 72.7 per cent of the white insane. Similar figures for the two classes in the main geographic divisions are presented in the following tabular statement:

DIVISION.	GENERAL NATIVE WHITE POPULATION 1900.		NATIVE WHITE INSANE OF KNOWN PARENTAGE ENUMERATED IN HOSPITALS, DECEMBER 31, 1903.	
	Per cent of native parentage.	Per cent of foreign parentage.	Per cent of native parentage.	Per cent of foreign parentage. ¹
Continental United States.....	72.3	27.7	72.7	27.3
North Atlantic.....	62.4	37.6	63.2	36.8
South Atlantic.....	64.0	36.0	65.0	35.0
North Central.....	63.4	36.6	68.7	31.3
South Central.....	62.5	37.5	62.5	37.5
Western.....	64.9	35.1	72.0	28.0

¹ Includes mixed parentage.

An inspection of the above figures shows that in every division, except the South Central, the native whites of foreign parentage, as compared with the native whites of native parentage, appear to even greater advantage than in continental United States. This is especially true in the North Central and Western states.

The percentage of native whites of foreign parentage is lower for the native white insane in hospitals than for the general native white population in every state in which the data are sufficient for significant rates, except Pennsylvania, Delaware, Iowa, Missouri, Alabama, Louisiana, and Arkansas.

Although the figures in most instances indicate that the native whites of foreign parentage contribute a relatively smaller number of insane in hospitals than the native whites of native parentage, this fact has little bearing upon the comparative liability to insanity of the two classes. The truth is that the native whites of foreign parentage are still too youthful to furnish a number of insane proportionate to their representation in the population, as may be seen by comparing the percentages of the native whites of native parentage with those of native whites of foreign parentage in the age periods in which insanity is most likely to occur. The data for such a comparison are presented in the following tabular statement, which gives the figures for the age groups between 25 and 44 years, the period in which insanity is most likely to occur:

AGE.	NATIVE WHITE POPULATION 25 TO 44 YEARS OF AGE.			
	General: 1900.		Enumerated in hospitals for the insane, December 31, 1903. ¹	
	Per cent of native parentage.	Per cent of foreign parentage.	Per cent of native parentage.	Per cent of foreign parentage. ²
25 to 44 years.....	70.0	30.0	66.6	33.4
25 to 29 years.....	68.8	31.2	66.2	33.8
30 to 34 years.....	69.4	30.6	65.4	34.6
35 to 39 years.....	70.1	29.9	66.8	33.2
40 to 44 years.....	72.9	27.1	67.7	32.3

¹ Excludes parentage unknown.

² Includes mixed parentage.

A study of the preceding tabular statement shows that in the age groups from 25 to 44 years those of foreign parentage constituted a larger percentage of the native white insane of known parentage enumerated in hospitals on December 31, 1903, than of the general native white population of 1900. It also shows that as the age periods advance the proportion of the native white general population with native parents increases, while that with foreign parents declines. It might be permissible, therefore, to infer that if the age distribution of the native whites of foreign parentage, instead of showing a comparatively greater concentration in the earlier age groups, were similar to that of the native whites of native parentage, the relative number of insane contributed by the two classes would at least be equal.

Immigration on a large scale is of too recent origin to make it possible to demonstrate with any degree of exactness how far insanity occurs with greater or with less frequency among the native whites of native parentage than among the native whites of foreign parentage. Whether the percentages of insane shown for the last-mentioned group are not on the whole rather in advance of their numerical strength in the country must also remain an open question for the present. If it should prove so, it would only be the expected, so far as it concerns the children born in the United States of parents from a country that furnishes

a relatively large proportion of insane—for instance, Ireland, Scandinavia, or Germany.

In regard to the nationalities that compose the greater part of the most recent immigration, it is known that they show the least liability to insanity of all foreign born; but whether their descendants will show similar freedom from the disease can only be determined when they have reached mature age.

Nationality of foreign born white insane.—Table 6 (page 100) shows, for states and territories, the foreign born white insane enumerated in hospitals on December 31, 1903, classified by country of birth. Since the population figures at hand for 1903 make no distinction as to country of birth, it is impracticable to show the exact ratios of insane of each nationality to the total

representation of the same nationality in continental United States or any of its subdivisions for that year. A knowledge, sufficiently accurate for general purposes, of the proportion in which the various foreign born groups in the general population contribute to the number of insane in hospitals may be had by comparing the percentages which the nationalities specified constitute of the foreign born white insane, with the percentages which the same nationalities constitute of all foreign born, as stated in the returns of the Twelfth Census.

Table xiv shows the per cent distribution, by country of birth, of the foreign born white insane enumerated in hospitals on December 31, 1903, for states and territories.

TABLE XIV.—PER CENT DISTRIBUTION, BY COUNTRY OF BIRTH, OF FOREIGN BORN WHITE INSANE ENUMERATED IN HOSPITALS, DECEMBER 31, 1903, FOR STATES AND TERRITORIES.

Hungary and Bohemia	2.9	2.7	2.5	3.7	3.5	0.5
Russia and Poland	7.8	10.0	10.6	6.7	4.0	1.8
Other countries	9.2	7.1	12.0	6.9	27.8	24.1

¹ Includes Newfoundland.

Ireland furnished only 15.6 per cent of all foreign born in the United States in 1900, but 29 per cent of all foreign born white insane enumerated in hospitals on December 31, 1903. Similar relations between the two percentages will be observed for each geographic division, that is to say, the percentage of Irish born in the foreign born white insane in each division is about twice as large as the percentage of Irish born in the total foreign born population for the same group. Nor are the respective percentages found to hold much different relations when examined for individual states, as may be seen from the following grouping in which states have been selected containing the largest numbers of Irish born persons:

STATE.	PER CENT IRISH AMONG FOREIGN BORN IN—	
	General population, 1900.	White population of hospitals for insane, December 31, 1903.
Connecticut	29.8	53.9
Massachusetts	29.5	53.3
New York	22.4	40.3
New Jersey	22.0	40.7
Pennsylvania	20.9	36.4
Illinois	11.9	19.0
Michigan	5.4	12.7
Missouri	14.7	27.3
California	12.1	25.6

Relative to their numbers the Irish furnish a much larger proportion of the white foreign born insane in hospitals than any other nationality. This is in keeping with the very high ratio of insanity in Ireland, to which reference has already been made. It has been suggested that the greater concentration of the Irish in the chief centers of population may account in part for the high ratio of insanity they show when compared

with other foreign born from western and northern Europe. But the concentration in urban communities of the Irish born population is not much greater than that of the German born, for instance, who show relatively a much lower ratio of insanity.

The Germans constituted 25.8 per cent of all foreign born in the United States in 1900, and contributed 26.9 per cent of all foreign born white insane in hospitals in 1903. The proportion of German insane to the total foreign born white insane is greater than the proportion of this nationality to the total foreign born in the North Atlantic, South Central, and Western divisions, the difference between the per cents being, respectively, 2.7, 3.9, and 4.8 per cent. In each of the other geographic divisions the percentage of Germans among the foreign born white insane is smaller than the percentage which Germans form of all the foreign born. To facilitate comparisons for single states the percentages of Germans among the foreign born white insane, together with the percentages the Germans form of all foreign born, are given below for some of the states in which the Germans are most strongly represented:

STATE.	PER CENT GERMAN AMONG FOREIGN BORN IN—	
	General population, 1900.	White population of hospitals for insane, December 31, 1903.
New York	25.3	25.7
New Jersey	27.7	28.3
Pennsylvania	21.6	25.8
Maryland	47.9	42.6
Ohio	44.5	48.0
Indiana	51.7	54.8
Illinois	34.4	33.6
Wisconsin	47.1	45.0
Minnesota	23.2	21.0
Missouri	50.5	44.0
California	19.7	22.6

The German immigration since 1900 has probably not perceptibly affected the actual percentage of Germans among all foreign born, so that the comparison is fairly accurate. In 6 out of the 11 states given above the percentage of insane among Germans is in excess of their percentage of the total foreign born, but not markedly so.

The natives of England and Wales constituted 9 per cent of the foreign born in the United States in 1900, and were represented by 7 per cent of the foreign born white insane found in hospitals three years later. In each geographic division the English and Welsh form a larger percentage of the total foreign born than of all foreign born white insane, the favorable difference being from about 1 to 3 per cent. Conditions in 6 states containing comparatively large numbers of English and Welsh are shown by the following figures:

STATE.	PER CENT ENGLISH AND WELSH AMONG FOR- EIGN BORN IN—	
	General population, 1900.	White population of hospitals for insane, December 31, 1903.
Massachusetts.....	9.9	9.1
New York.....	7.5	6.1
Pennsylvania.....	15.3	9.6
Ohio.....	12.3	8.8
Illinois.....	7.1	5.1
California.....	10.3	8.1

More favorable conditions, on the whole, are to be observed among the Canadians than among the English and Welsh. Persons of Canadian birth, including those from Newfoundland, formed 11.4 per cent of all foreign born in the United States in 1900, yet contributed only 6.5 per cent of the foreign born white insane in 1903. What is true for continental United States is also true for each geographic division; that is, the percentage of Canadians is considerably larger among the total foreign born than among the foreign born white insane in hospitals. The figures for the states in which the Canadians are particularly numerous confirm the general statement made, as is shown in the following tabular statement:

STATE.	PER CENT CANADIAN ¹ AMONG FOREIGN BORN IN—	
	General population, 1900.	White population of hospitals for insane, December 31, 1903.
Maine.....	71.9	42.6
New Hampshire.....	66.9	44.3
Massachusetts.....	34.6	18.6
New York.....	6.2	3.8
Illinois.....	5.2	3.7
Michigan.....	34.0	23.3
Minnesota.....	9.4	6.8
North Dakota.....	24.9	12.9

¹ Includes Newfoundland.

The Scandinavians (persons born in Sweden, Norway, and Denmark) are apparently much less liable to insanity than the Irish but somewhat more so than the Germans. At the census of 1900, 10.3 per cent of the foreign born were found to be Scandinavians, and they constituted 11.5 per cent of the foreign born white insane in hospitals in 1903. In each geographic division, except the North Atlantic and Western, there is the same disparity between the respective percentages. The states containing the largest numbers of Scandinavians also have relatively more persons of this nationality among the foreign born white insane than among the foreign born general population, as is shown in the following statement:

STATE.	PER CENT SCANDINAVIAN AMONG FOREIGN BORN IN—	
	General population, 1900.	White population of hospitals for insane, December 31, 1903.
Illinois.....	15.0	19.6
Michigan.....	7.6	12.0
Wisconsin.....	20.1	24.3
Minnesota.....	46.8	50.0
North Dakota.....	37.6	53.4
South Dakota.....	37.8	45.6
Kansas.....	15.4	20.9
California.....	7.8	8.5

The large difference between the percentages under consideration shown for North Dakota has been attributed by competent authorities to the effect of environment and climate. The conditions on the prairies are in sharp contrast to conditions on the Scandinavian peninsula, whence the inhabitants of North Dakota so largely come.

In the United States as a whole and in each of the geographic divisions, persons of Scottish birth form a smaller percentage of the foreign born white insane in hospitals than of the foreign born population. The same fact is apparent for the states given below, which contain the greatest number of Scottish born:

STATE.	PER CENT SCOTCH AMONG FOREIGN BORN IN—	
	General population, 1900.	White population of hospitals for insane, December 31, 1903.
Massachusetts.....	2.9	2.5
New York.....	1.8	1.3
New Jersey.....	3.3	2.2
Pennsylvania.....	3.1	2.0
Illinois.....	2.1	1.6

The comparisons of the percentages of the total foreign born in 1900 with the percentage of foreign born white insane enumerated in hospitals on December 31, 1903, are less equitable to the Italians than to the other foreign nationalities discussed so far, owing to the heavy immigration from Italy during the years intervening between the censuses. That is to say, the percentage which Italians form of all foreign born has increased greatly since 1900.

Nevertheless, the Italians show a proportion among the foreign born in the general population very materially in excess of their proportion among the insane. For the United States the percentage of Italians among all foreign born in 1900 was 4.7, and their percentage among the foreign born white insane in 1903 but 2.3. For the North Atlantic states the respective figures are 7.4 and 3; for the South Atlan-

tic, 4.9 and 2.7; for the North Central, 1.3 and 0.7; for the South Central, 7.3 and 4.1; and for the Western, 4.8 and 4.1.

The individual states containing the largest colonies of Italians yield the following percentages:

STATE.	PER CENT ITALIAN AMONG FOREIGN BORN IN—	
	General population, 1900.	White population of hospitals for insane, December 31, 1903.
Massachusetts.....	3.4	1.8
New York.....	9.6	3.6
New Jersey.....	9.7	3.3
Pennsylvania.....	6.8	2.7
Illinois.....	2.4	1.5
California.....	6.2	5.3

Since the Italians in the United States are chiefly city dwellers in communities where the insane are quickly taken in hand by the proper authorities, it is impossible to construe the statistics adduced, except as indicative of a low ratio of insanity. While perhaps less inclined than some other foreigners to seek institutional care, experience does not show that the Italians commonly try to keep the insane in their homes, where such a course is possible. An enumeration of the Italian born insane outside of the hospitals would therefore not be likely to show materially increased percentages. The comparative youthfulness of the Italian immigrants and the migratory character of the colonies may be factors in producing a low ratio of insanity, but the fact that not a single state shows an exception to the rule warrants the belief that the Italians are really less prone to insanity than the other nationalities enumerated.

In contrast to the Italians, the French in the United States constitute everywhere, except in the South Atlantic division, a higher percentage of the foreign born white insane than of the total foreign born. The French contingent is, however, numerically small, and, except in a few places, hardly typical of the French nation. In Louisiana, where the French born constitute 12.3 per cent of all foreign born, their percentage of the foreign born white insane in hospitals in 1903 was 14.4. The second largest percentage of foreign born white insane who are of French birth, namely, 4.6, occurs in California. There the same element of population constituted 3.3 per cent of all foreign born.

The immigrants from Hungary and Bohemia constituted 2.9 per cent of all foreign born in the United States in 1900 and contributed 2.2 per cent of all the foreign born white insane in hospitals in 1903. Similar differences between the percentages are found for the North Atlantic, South Atlantic, and North Central states. In the South Central division, however, the group of foreign born under consideration constituted 4.1 per cent of all the foreign born white insane in 1903,

and only 3.5 per cent of the foreign born population in 1900. The percentages are equal in the Western division.

The statistics for 5 states with a relatively numerous representation of Hungarians and Bohemians are given below:

STATE.	PER CENT HUNGARIAN AND BOHEMIAN AMONG FOREIGN BORN IN—	
	General population, 1900.	White population of hospitals for insane, December 31, 1903.
New York.....	2.8	2.3
Pennsylvania.....	5.2	3.1
Illinois.....	4.7	4.4
Nebraska.....	9.4	6.9
Texas.....	5.5	7.3

Whether immigration from Hungary and Bohemia to Texas subsequent to 1900 has been of such dimensions as to account for the exceptionally large percentage of the foreign born white insane born in these countries is not definitely known, but it probably offers the correct explanation, which would also account for the unfavorable percentage shown for the South Central division.

The group of insane designated as persons born in Russia and Poland comprehends several distinct nationalities which it would have been desirable to separate for the sake of an accurate classification. The immigration from Russia is largely one of Hebrews, while that from Poland includes a large number of Polish Hebrews, and also very many true Poles. But since the census of population does not distinguish the persons of Hebrew race from other immigrants of the same country, a statement of the number of Hebrews found among the insane would have lacked a basis for comparisons. The term Poland, as used in this report, refers to the three divisions of Poland as given in the Census publications.

Conditions among the Russians and Poles of this country in respect to the proportion of insane among them approach those observed for the Italians. At the last census 7.8 per cent of the total foreign born in the United States were natives of Russia and Poland, and in 1903 the same nationalities furnished 4.4 per cent of all the foreign born white insane in hospitals. Practically the same differences between the percentages exist in each geographic division, except the Western, where the percentage of foreign born white insane who are Poles and Russians, is identical with the percentage that these people form of the total foreign born. But, as in the case of the Italians, it should be remembered that an immigration of extraordinary magnitude from Russia and Poland has taken place since 1900, and the percentages given for that year do not indicate the full strength of Russians and Poles among all the foreign born. In consequence, the pos-

sible comparisons really exaggerate the ratio of insanity among the Russians and Poles so far as hospital statistics reveal it.

The percentages for seven states follow:

STATE.	PER CENT RUSSIAN AND POLISH AMONG FOREIGN BORN IN—	
	General population, 1900.	White population of hospitals for insane, December 31, 1903.
Massachusetts.....	5.7	2.7
New York.....	12.4	6.8
Pennsylvania.....	12.9	8.6
Illinois.....	10.0	5.7
Maryland.....	15.9	9.7
South Dakota.....	14.5	5.3
Kansas.....	9.3	4.0

In states with Russian and Polish contingents largely of the Hebrew race, for instance, Massachusetts, New York, and Maryland, the prevalence of insanity appears to be very much the same as in states with a preponderance of true Poles, for instance, Pennsylvania, where so many of this nationality are engaged in mining, and South Dakota and Kansas, where they are more occupied with agricultural pursuits.

No distinction as to country of birth has been made in the case of 7.3 per cent of the total foreign born white insane. Percentages of some magnitude are met with for single states under the head "other countries" in Table xiv. Thus the 11.8 per cent of the foreign born white insane in Michigan who were born in "other countries" are, for the most part, presumably of Dutch origin, while some are Finns. In Texas the foreign born white insane not referred to any specified country of birth form 27.7 per cent of the total white insane born in foreign countries, and probably include chiefly Mexicans, who in 1900 constituted 39.6 per cent of the total foreign born in that state.

The order of the foreign nationalities enumerated in Table xiv with regard to the relative numbers of insane they contributed to the hospital population in 1903 is about as follows:

- | | |
|-------------------|------------------------------|
| 1. Irish. | 6. Hungarians and Bohemians. |
| 2. Scandinavians. | 7. English and Welsh. |
| 3. Germans. | 8. Italians. |
| 4. French. | 9. Russians and Poles. |
| 5. Scotch. | 10. Canadians. |

While the above arrangement can not be insisted upon as representing in all instances the exact positions occupied by these nationalities, so far as the frequency of insanity among them is concerned, it is confirmed by independent investigations and conforms to other recorded experience.

It is primarily the business of the alienist to trace the relation between the foregoing classification of the immigrant races and the probable causes that make some of them seem so much more liable to insanity than others. It is generally held that the nationalities showing the least liability to insanity are also among the

most primitive in point of education and standard of living. Given comparative freedom from vice and comparative virility of stock, so the argument runs, and it will be seen that the mental equilibrium is more frequently upset in the instance of the highly organized nationalities; that is, they show less ability to withstand the shocks of a new environment, the pressure of unwonted economic conditions, etc., than the nationalities lower in the social scale. It is further asserted that an increase of insanity is a concomitant of present day civilization, and that when the disease appears to be alarmingly prevalent in a nationality which as a whole has not reached a very high level there will usually be found in such a nationality the taint of a common vice.

The facts brought out in the present investigation in regard to the comparative liability to insanity of the immigrants hardly suffice for a confirmation of the above views. The matter is one that must be studied in the light of the statistics of the insane for the countries whence the nationalities in question come. In the case of the English and Welsh, for instance, it was shown that they stand seventh among the foreign nationalities in the United States with regard to the relative number of insane they contributed to the insane population in hospitals in 1903. Yet the number of insane per 100,000 of population in England and Wales is very much larger than the corresponding number for the United States. England and Wales also show much larger ratios of insane than Germany or the Scandinavian peninsula.

According to the classification made of the immigrants with respect to their liability to insanity, the Canadians show the least liability to this disease. Nevertheless, the ratio of the insane in Canada, whether only the number in hospitals or the total for the country be considered, exceeds the ratio for the United States, and is higher than the ratios for the Scandinavian countries and Germany. Yet the Scandinavians and Germans contribute relatively larger numbers to the insane population of this country.

This rather striking discrepancy between the comparatively slight liability to insanity exhibited by some nationalities among the immigrants and the known large ratios of the insane in their home countries can hardly be due to the fact that some of them are represented in the United States by the best of their stock while others send over the least fit. It is significant that insanity is apparently most prevalent in the nationalities who were among the earliest immigrants to this country and contributed the sturdiest of their people. It may therefore be that an explanation of these discrepancies is that conditions of American life are conducive to an increase in insanity.

The statistics of the insane for the countries from which most of the recent immigrants came are lacking or are too meager for purposes of comparison. The comparatively primitive condition of some of these peoples may perhaps for the present render them less

liable to insanity than others. At least this appears to be true of the immigrants from eastern and southern Europe.

In the light of the available information it would be just as fanciful to speculate about the immediate specific causes of insanity in this or that race as it often is in the case of an individual.

Table xv, based on Table 7 (page 101), gives the

per cent distribution of the foreign born white insane admitted to hospitals in 1904 according to country of birth. The notably higher percentages shown for Italians, Russians, and Poles than in the statistics of 1903 are in perfect keeping with the extensive immigration of these nationalities during recent years. In all respects the figures contained in Table xv corroborate those in Table xiv.

TABLE XV.—PER CENT DISTRIBUTION, BY COUNTRY OF BIRTH, OF FOREIGN BORN WHITE INSANE ADMITTED TO HOSPITALS DURING 1904, FOR STATES AND TERRITORIES.

¹ Includes Newfoundland.

² Per cent not shown where base is less than 100.

Present age.—Table xvi shows the distribution, by age, of the insane in hospitals at sometime during 1904, classified by sex, and the per cent distribution of the general population in 1900, classified by sex.

Throughout the discussion of the figures in Table xvi, and in fact of all statistics concerning the age of the insane in hospitals, it should be borne in mind that no children under 12 years of age are included.

TABLE XVI.—DISTRIBUTION, BY AGE, OF INSANE OF KNOWN AGE UNDER 100 YEARS, IN HOSPITALS: 1904.

AGE.	INSANE IN HOSPITALS: 1904.						PER CENT DISTRIBUTION OF GENERAL POPULATION: 1900.

¹ Less than one-tenth of 1 per cent.

The entire number of insane under 15 years of age was 285, or 0.1 per cent of the total. It is perhaps open to question whether some of the persons of tender years included in the table should not be classified as feeble-minded rather than as insane. There are others who perhaps under a strict differentiation would be put down simply as epileptics. Where special institutions for feeble-minded and epileptics are not at hand the tendency to commit such persons as insane is particularly evident. It is of course not the province of the census enumerator to make these distinctions, but simply to count as insane those who are committed to insane hospitals.

Among the general population the numbers in each successive age group decrease, while among the insane the numbers in the quinquennial periods rise rapidly until that of 30 to 34 years is reached and then con-

tinuing a gradual advance, attain their maximum for both sexes in the period 40 to 44 years. Thence begins a decline, which, however, is more marked in the case of males than of females. In other words, the figures point to the greater longevity of the female insane in hospitals. Of the total, 16.9 per cent were under 30 years of age, 48.7 per cent between 30 and 50, and 34.4 per cent at least 50.

Table 12 (page 122) shows the insane in hospitals at some time during 1904, classified by sex, color, nativity, and race, and quinquennial age periods. Table XVII, derived from Table 12, gives the per cent distribution, by age, of these insane, classified by color, nativity, and race. As the insane of unknown age were included in computing the per cents in Table XVII the figures for the aggregate do not exactly correspond with those given in Table XVI.

¹ Having one parent native and the other foreign, or one parent unknown and the other either native or foreign.² Per cent not shown where base is less than 100.³ Less than one-tenth of 1 per cent.

On the whole the figures in Table xvii indicate that insanity occurs at an earlier age among negroes than among whites. In the age periods under 35 years, of which those from 20 to 34 years are the significant periods, the percentages of negro insane are uniformly higher than the percentages of the whites. The proportion of negroes begins to decline in the age period 35 to 39 years, which for several of the groups of white insane does not even mark the maximum, and it decreases at a faster rate through the subsequent periods, but the decline is fairly uniform except in the period 55 to 59 years. Of both the native and foreign born whites, the largest proportions are in the age period 40 to 44 years, after which a diminution, very marked

in some periods, is observed. Or, to put the matter differently, 35.7 per cent of the negro insane in hospitals are between 20 and 34 years of age as compared with 29 per cent of the native white and 18.1 per cent of the foreign born white.

*Age at admission.*¹—Tables 9 and 11 (pages 104 and 116) show individual ages of insane at admission to hospitals, the first for the population enumerated as of December 31, 1903, and the second for the persons admitted during 1904, for states and territories. Table xviii shows the distribution, by age at admission, of the insane in hospitals at some time during 1904, for main geographic divisions.

¹ Less than one-tenth of 1 per cent.

The consideration of the ages at which the insane were admitted to hospitals is of course most important, and also one into which an element of uncertainty enters. Many persons are committed to hospitals as insane more than once during their lives, although not always to the same hospital. It can not be stated, therefore, that the recorded age of admission of each individual invariably applies to the first admission. Yet the margin of error is probably so small as not to affect the significance of any general deductions.

Of the insane in hospitals at some time during 1904 but 0.4 per cent were admitted at ages under 15 years. The proportion is 4.3 per cent, in the age period 15 to 19 years, rising to 11 per cent in the period 20 to 24 years, and attaining the maximum, 13.7 per cent, in the age period 25 to 29 years. There is, however, but a very slight difference between the percentage for the last-mentioned period and that for the next, 30 to 34 years, which shows 13.6 per cent; and this difference is explained by the larger percentages in the age period 25 to 29 years found in the South Atlantic and South Central states, where the colored insane exist in

the greatest numbers. It will be noticed, also, that in the age periods under 15 years and 15 to 19 years the percentages in these two divisions are larger than in the others. This fact clearly points to the occurrence of insanity at an earlier period among the negroes than among the whites.

Both in the North Atlantic and in the North Central states the percentages of admissions are almost precisely equal at the age periods 25 to 29 years and 30 to 34 years. In the Western division the percentage is larger in the period 30 to 34 years. There is but little difference between the numbers of insane admitted in these two periods, and it is a safe generalization to state that admissions of insane to hospitals are most numerous between the ages of 25 and 34, or, on the basis of the figures for the total insane, about 27 per cent of all cases occur in those age groups. These figures correspond in general to statistics of ages at admission in European countries where the maximum percentage is usually found in the ages between 25 and 34 years.

With the period 30 to 34 years begins a decline in the

percentages for continental United States, the South Atlantic, and the South Central divisions. For the other divisions it begins with the period 35 to 39 years. The percentages of admissions diminish rapidly in the subsequent age periods, and the proportion is smaller for the ages 55 to 59 years than for the ages 15 to 19 years in the United States as a whole and in each division except the North Atlantic and the Western, in which the difference is very slight.

In all, 55.3 per cent of the insane in hospitals, or more than one-half, were admitted under the age of 40, and only 18.1 per cent after the fiftieth year had been reached. It is probable that the last-mentioned percentage would be somewhat larger if the ages could

have been ascertained in all cases. The number of cases in which the age was not known, however, forms too small a proportion, 8.6 per cent, of the aggregate insane in hospitals to invalidate general conclusions.

Average ages at admission.—Another view of the subject of age at admission is obtained from Table 26 (page 160) which gives the average age at admission of all insane in hospitals, whether enumerated on December 31, 1903, or admitted during 1904, classified by sex, color, nativity, and race, for states and territories. Table XIX presents a summary of these average ages for the elements of the population in each main geographic division.

¹ Having one parent native and the other foreign, or one parent unknown and the other either native or foreign.

Of the total number of insane in the United States the average age at admission to hospitals is 38.5 years. The highest average ages occur in the North Atlantic and Western divisions, and the lowest in the South Atlantic and South Central, a difference which is caused by the large number of negro insane in the latter states, who are uniformly admitted to hospitals at an earlier age than the white. In all divisions the average age of females at admission is higher than that of males, the difference between the sexes being especially marked in the North Atlantic states, where the average age of females is 2.1 years greater than that of males.

Considered by elements of population, the lowest

average age at admission (35.6 years) is noted for the negroes, and the highest (41.7 years) for the foreign born whites. This disparity between the average ages is, of course, caused by the relatively smaller number of insane of youthful years among the foreign born whites. Of the native white insane of native parentage the average age at admission is 38.4 years, while that of the native white of foreign parentage is 4.1 years lower. The explanation of this difference lies in the fact that a relatively small proportion of the last-mentioned group has reached mature age. The same condition exists among the native white insane of mixed parentage, whose average age is 3.4 years lower than that of the native white of native parent-

age. The average age of native white insane of native parentage is 3.4 years higher in the North Atlantic states than in the South Central. In this element of population the average age of female insane is higher than that of males for all geographic divisions except the Western, and especially for the North Atlantic states. A similar difference in the ages of the sexes is observed with regard to the native whites of mixed parentage, except in the South Central and Western divisions, in each of which groups, however, the number of female insane belonging to this class is too small to yield a significant average. The latter observation applies to the female negroes in the West-

ern division, in which the average age of male negroes at admission is higher. In each of the other main geographic divisions the average age of the male negroes is slightly lower at admission to hospitals.

Marital condition.—Table 27 (page 162) shows the insane in hospitals at sometime during 1904, classified by sex, color, nativity, race, and marital condition, for geographic divisions. The per cent distribution, by marital condition, of these insane, classified by sex, color, nativity, and race, is given for geographic divisions in Table 28 (page 164), and for continental United States only in Table xx.

¹ Having one parent native and the other foreign, or one parent unknown and the other either native or foreign.
² Per cent not shown where base is less than 100.

In 5,820 cases, or 2.9 per cent of the total number involved (199,773), the marital condition could not be ascertained. In the aggregate about one-half of the insane in hospitals are shown to be single. But the percentage of single varies considerably for the different elements of population. It is largest, 63.7 per cent, among the native white insane of foreign parentage, and naturally so, since they are recruited from a comparatively youthful population.

Excepting the Mongolians, for whom no adequate comparisons can be made owing to the disparity of the sexes among them, the next largest proportion of single, 58.8 per cent, is shown by native white insane of mixed parentage, who also in large part belong to the younger generation. A little more than one-half of the native white insane of native parentage are single. The smallest proportion of unmarried, 43.3 per cent, is found among the foreign born

white insane, and the next smallest, 45.7 per cent, among the negro insane.

In the aggregate 72,100, or 36.1 per cent, of the insane were returned as married. The variations in the percentages married for the different elements of the insane population are, of course, closely connected with the variations observed in regard to the corresponding proportions of single, the foreign born whites showing the highest percentage, native whites of foreign parentage the lowest, etc.

The widowed insane number 19,365, or 9.7 per cent of the total. Among the white insane the foreign born white show the highest percentage of widowed and, for reasons already indicated, the native white of foreign and of mixed parentage the lowest percentages. A notably high percentage of widowed occurs also among the negroes.

When the marital condition of the insane males is

considered, the preponderance of single persons in the total for this sex is very marked, the percentage of single being 59.4 for the aggregate. For the native white of foreign parentage and the foreign born white, who are again at opposite extremes, the percentages of single are 72.1 and 53.6, respectively. The married males form 30.2 per cent of the aggregate and the widowed males but 5.8 per cent.

Among the aggregate female insane, on the other hand, the proportion of single persons, 39.7 per cent, is smaller than that of married, 42.7 per cent. When considered by elements of population, it is found that the percentage of female insane married is smaller than the percentage unmarried, except among the foreign born whites and the negroes. The proportion of widowed is also very large among the female insane, the per cent being 14.1 for the aggregate, with a maximum of 18.1 for the foreign born white.

The percentage of each marital class among the aggregate insane is shown for geographic divisions in the next tabular statement. In the matter of sex the percentages for each marital class are in close correspondence for the North Atlantic and South Atlantic states, both of which have an excess of single among the female insane as well as among the male.

DIVISION.	PER CENT OF INSANE IN HOSPITALS: 1904.				
	Single.	Married.	Widowed.	Divorced.	Unknown.
Continental United States..	50.1	36.1	9.7	1.2	2.9
North Atlantic.....	51.5	35.2	10.9	0.7	1.7
South Atlantic.....	51.8	34.2	9.9	0.3	3.8
North Central.....	48.1	37.7	9.1	1.9	3.2
South Central.....	46.7	39.0	8.8	0.7	4.8
Western.....	54.8	31.9	7.3	1.7	4.3

But in the North Central, South Central, and Western divisions there were more married than single females among the insane, especially among the foreign born white insane. The proportions for the female insane of the last-mentioned element are 27.2 per cent single and 53.1 per cent married in the North Central division, and 24.2 per cent single and 55.8 per cent married in the Western. There is a less pronounced difference between the corresponding percentages for native white female insane of native parentage.

Literacy and illiteracy.—Table 29 (page 166) shows the number and percentages of the insane in hospitals at sometime during 1904 who can read and write, can read only, and can neither read nor write, by sex, color, nativity, and race, for the main geographic divisions. A summary for continental United States giving percentages only is presented in Table XXI.

TABLE XXI.—PER CENT ILLITERATE AMONG INSANE AT LEAST 10 YEARS OF AGE IN HOSPITALS, CLASSIFIED BY SEX, COLOR, NATIVITY, AND RACE: 1904.

¹ Having one parent native and the other foreign, or one parent unknown and the other either native or foreign.

² Per cent not shown where base is less than 100

An inquiry into the degree of education obtained by the insane prior to commitment is chiefly of value as a means of determining whether insanity is a frequent or infrequent concomitant of an undeveloped mental condition. It also helps to illustrate how far the insane are drawn from the classes containing proportionately the largest number of illiterates.

As none of the insane are under 10 years of age, the whole number involved is 199,773, for 10,850, or 5.4 per cent, of whom the facts in regard to education were not reported. In all 77.7 per cent had been taught to read and write, 2 per cent to read but not to write, and 14.9 per cent had not been taught either to read or to write. Among the illiterate there are doubtless a good many who have been feeble-minded from birth or early youth. The white insane show 80.5 per cent who could read and write, with 5.4 per cent unknown, as compared with 37.2 per cent for the negroes, with 4.6 per cent unknown. The percentage of white illiterates is 14.1 and of negro illiterates 58.2. The percentages of literates among the native whites of native, foreign, and mixed parentage are about the same, being respectively 86.9, 88, and 88.6 per cent, while among the foreign born whites the corresponding proportion is 74.1 per cent. On the other hand, the foreign born white insane show 17.8 per cent illiterate, as compared with 12.1 per cent for the native white insane.

Whether examined in the aggregate or by each element of population, it will be seen that there are relatively more male than female insane who have been taught to read and write, and that in consequence the percentage of illiterate females is uniformly larger.

For geographic divisions the aggregate proportions of illiterates are as follows: North Atlantic, 15.8 per cent; South Atlantic, 29.1 per cent; North Central, 12.7 per cent; South Central, 27.7 per cent; and Western, 11.6 per cent. The number of negroes involved accounts for the relatively large number of illiterates in the South Atlantic and South Central groups.

The percentage of illiterates among the foreign born white insane is 21.4 in the North Atlantic states, 18.6 in the South Atlantic, 14.3 in the North Central, 23.8 in the South Central, and 12.7 in the Western. That these percentages of illiterates are not higher would be surprising were it not known that the nationalities contributing the largest proportion of insane also stand highest from an educational point of view.

Occupation prior to admission.—Table 30 (page 168) shows the numerical distribution, by previous occupation, of the insane in hospitals at sometime during 1904, whose occupation prior to admission is known, classified by color, nativity, and race, for main geographic divisions. A similar distribution and classification of the male insane of known previous occupation is given in Table 31 (page 175) and of the females in Table 32 (page 183). These tables include in the aggregate 129,860 patients, which leaves a total of 69,913 insane

who had no previous occupation or in regard to whom the facts could not be ascertained. For the United States as a whole the per cent distribution, by previous occupation, of the insane in hospitals at sometime during 1904, whose occupation prior to admission is known, classified by sex, color, nativity, and race, is given in Table xxii.

The largest percentage of insane, 41.6, is composed of persons returned as laborers and servants. This class constitutes 40 per cent of the white insane, 61.5 per cent of the negro, and 51.5 per cent of the foreign born white. The second largest percentage of insane, 22.5, had been engaged in agriculture, transportation, and other outdoor work, but only 15.2 per cent of the foreign born white insane and 12.8 per cent of the negro are reported as having been engaged in occupations of this sort, as compared with 28 per cent of the native white. Third in magnitude is the percentage of insane, 16, who had been occupied in manufacturing and the mechanical industries. So far as this class of occupations is concerned the percentages for the various white elements of the insane population are not very dissimilar, but for the negroes the percentage is smaller.

In the aggregate about 80 per cent of the insane were engaged, prior to commitment, in the occupations described as laboring and servant, manufacturing and mechanical industry, and agriculture, transportation, and other outdoor work.

The percentages for these three classes of occupation vary considerably in the geographic divisions, as may be ascertained from the following tabular statement:

DIVISION.	PER CENT OF INSANE OF KNOWN PREVIOUS OCCUPATION WHOSE OCCUPATION PRIOR TO ADMISSION HAD BEEN—		
	Laboring and servant.	Manufacturing and mechanical industry.	Agriculture, transportation, and other outdoor.
North Atlantic.....	45.2	21.6	11.5
South Atlantic.....	34.4	11.0	25.9
North Central.....	42.3	13.1	28.6
South Central.....	27.4	7.0	45.1
Western.....	43.4	14.7	26.3

Of the insane, 78.3 per cent had been engaged in the three classes of occupations under consideration in the North Atlantic division, 71.3 per cent in the South Atlantic, 84 per cent in the North Central, 79.5 per cent in the South Central, and 84.4 per cent in the Western.

The figures in Table 31 show that prior to commitment 30.7 per cent of the male insane were engaged as laborers and servants, 21.4 per cent in manufacturing and mechanical industries, and 31.7 per cent in agriculture, transportation, and other outdoor work—in all, 83.8 per cent of the total number. Of the other stated occupations, the highest percentage of male insane, 5.2 had been in "clerical and official" service.

ANALYSIS OF DATA.

35

¹ Having one parent native and the other foreign, or one parent unknown and the other either native or foreign.² Per cent not shown where base is less than 100.³ Less than one-tenth of 1 per cent.

According to Table 32 the occupations, prior to admission, of 37,879 insane women in hospitals have been returned. The occupations of females are as a rule different from those of males. No less than 68.3 per cent are reported to have been occupied in domestic work or as servants. The next largest proportion, 6.9 per cent, had been dressmakers and seamstresses, and the third largest, 4.8 per cent, teachers in schools. Of the foreign born white female insane 79.9 per cent had been occupied as housewives and servants. The percentage of white women in the same group is 69.6, and of negro women, 57.3.

The percentage of female insane who had been engaged in unspecified occupations, which is 10.5 for the United States, is 27.4 for the South Atlantic states, and 38.2 for the South Central.

The figures used in the above discussion of the occu-

pations of the aggregate female insane prior to admission are given in the following tabular statements:

OCCUPATION.	Percent- ages.
All occupations.....	100.0
Professional:	
Musicians and teachers of music.....	0.9
Teachers in schools.....	4.8

Telegraph and telephone operators.....	0.1
All other:	
Milliners.....	0.7
Dressmakers.....	6.9
Unspecified.....	10.5

On the whole, the question of the relation of insanity to occupation is one that still awaits systematic treatment. The available means of inquiry do not suffice even for a perfect classification of occupations, much less for obtaining data which permit exact comparisons of the number of insane drawn from any given occupation with the total number of the same age, nativity, nationality, etc., engaged in that particular occupation. Yet such comparisons are necessary if the object be to establish that any one occupation more than another tends to produce a state of

mental unbalance. The only really obvious fact at present is that the occupations which furnish the largest numbers with employment also contribute most of the insane.

Physical defects.—Table 33 (page 185) shows the physically defective insane in hospitals, classified by sex, color, nativity, and nature of defect, for states and territories. Table XXIII, which is based on Table 33, gives the per cent physically defective among insane in hospitals, classified by sex and elements of the population, for main geographic divisions.

TABLE XXIII.—PER CENT PHYSICALLY DEFECTIVE AMONG INSANE IN HOSPITALS, CLASSIFIED BY SEX, COLOR, NATIVITY, AND RACE, FOR MAIN GEOGRAPHIC DIVISIONS: 1904.

¹ Having one parent native and the other foreign, or one parent unknown and the other either native or foreign.
² Per cent not shown where base is less than 100.

The total number involved is 21,817, or 10.9 per cent, of all the insane. Of this aggregate, 13,322, or 12.6 per cent, were males and 8,495, or 9.1 per cent, females. In the aggregate more than one-half of all the physically defective are designated as epileptic. Of the remaining groups of the physically defective, the number classed as crippled, maimed, or deformed predominates. The aggregate percentage of the physically defective is smaller for the foreign born than for the other white elements of population; it is also smaller for the negro than for the native white. The number of epileptics is relatively larger in the South Atlantic and South Central states than in the other divisions, presumably because of the lack of special institutions for this class of sufferers in the South. The insane who are crippled, maimed, or deformed are relatively most numerous in the North Atlantic states, in which also the percentage both of male and of female insane in this class is larger than elsewhere.

The blind numbered 1,037, or 0.5 per cent, of the total insane; the deaf, 2,191, or 1.1 per cent; and the paralytic, 2,689, or 1.4 per cent. Relatively the numbers in these groups for the geographic divisions do not differ much from those for continental United States.

Time spent in hospitals.—In Table 34 (page 190) the insane in hospitals at sometime during 1904 are classified by sex and the number of years they have spent in such institutions, for states and territories.

Table xxiv gives the per cent distribution, by the number of years spent in hospitals, of these insane, for geographic divisions.

TABLE XXIV.—Per cent distribution, by total years spent in hospitals, of insane in hospitals, for main geographic divisions: 1904.

YEARS SPENT IN HOSPITALS.	PER CENT DISTRIBUTION OF INSANE IN HOSPITALS: 1904.					
	Conti- nental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.

5 to 9 years.....	16.4	16.8	15.8	16.5	15.6	15.5
10 to 14 years.....	10.5	11.2	9.2	10.4	9.5	10.3
15 to 19 years.....	6.2	5.8	5.9	6.8	5.7	6.1
20 years and over..	6.1	5.9	7.4	6.1	5.9	5.5
Unknown.....	7.0	7.5	5.8	7.5	4.0	7.5

Of the total insane in hospitals in continental United States, 27.8 per cent had been in hospitals less than one year. The percentages are somewhat larger for the South Atlantic and Western divisions than for the country as a whole. About 26 per cent, had been in hospitals from one to four years, so that in all considerably more than one-half of the insane enumerated had been inmates of hospitals for less than five years. Of the 39.2 per cent who had remained in hospitals for more than five years, 16.4

per cent had been there from five to nine years; 10.5 per cent, from ten to fourteen years; and 6.2 per cent from fifteen to nineteen years. Institutional life for more than twenty years had been the lot of 6.1 per cent of the whole number of insane. The highest proportion in this group, 7.4 per cent, is found in the South Atlantic division.

Table 35 (page 192) shows the insane in hospitals at some time during 1904, classified by sex and duration of their confinement during the present attack in the hospitals in which they now are, for states and territories. The following tabular statement gives the per cent distribution, by the duration of this confinement, of the insane in continental United States:

YEARS SPENT DURING PRESENT ATTACK IN HOSPITAL WHERE NOW CONFINED.	Per cent distribution of total insane in hospitals: 1904.
All periods.....	100.0
Under 1 year.....	36.6
1 year.....	8.8
2 years.....	7.6
3 years.....	5.9
4 years.....	4.9
5 to 9 years.....	16.8
10 to 14 years.....	9.8
15 to 19 years.....	5.1
20 years and over.....	4.4
Unknown.....	0.1

It is interesting to observe that the percentage of persons who have spent from five to nine years in hospitals during the present attack is slightly larger than the percentage shown for the same time period in Table xxiv, which gives total time in hospitals. In the period under one year and in those from one to four years the percentages pertaining to time in hospitals during present attack are naturally larger than the corresponding percentages relating to total time in institutions. It follows that the percentages in the periods ten to fourteen years, fifteen to nineteen years, and twenty years and over, are the reverse.

Discharges from hospitals.—During 1904, according to Table 36 (page 194), there were discharged from hospitals for the insane a total of 22,524 persons. Of the 21,459 white among this number, 11,563 were males and 9,896, females; while of the 1,065 colored (including Mongolians and Indians), 555 were males and 510, females.

Table 36 classifies the patients discharged from hospitals during 1904 by sex, color, and condition, for states and territories. The per cent distribution, by condition, of these patients, classified by sex and color, is given in Table xxv, for main geographic divisions.

TABLE XXV.—PER CENT DISTRIBUTION, BY CONDITION, OF PATIENTS DISCHARGED FROM INSANE HOSPITALS DURING 1904, CLASSIFIED BY COLOR AND SEX, FOR MAIN GEOGRAPHIC DIVISIONS.

COLOR, SEX, AND CONDITION.	PER CENT DISTRIBUTION OF PATIENTS DISCHARGED FROM INSANE HOSPITALS DURING 1904.

¹ Includes the recovered.

In reporting the condition of persons when discharged from hospitals for the insane it is customary to distinguish between the recovered, the improved, and the unrecovered. There is, however, no standard definition of what constitutes recovery from insanity. Some officials class as such all who show betterment, while others are very chary in describing their patients as having fully recovered. In consequence the percentages of recoveries reported from different institutions vary in an astounding degree. It therefore seemed wiser to group all recoveries under the head improved, and avoid the presentation of figures that could not be explained, and therefore might lead to wholly unfair comparisons. There is the further justification for this procedure in the fact that even complete recoveries are often but temporary. Besides, a person who has once been insane rarely assumes his place in society as a fully normal being.

For continental United States the percentage of the whites discharged who were classed as improved is 76.2 for both sexes. For the main geographic divisions the corresponding proportions vary from 68.3 per cent in the South Atlantic to 80.2 per cent in the South Central. The percentage of white females classed as improved at discharge is larger than that of white males for the United States as a whole and for each geographic group except the South Central, where the figures are practically the same for both sexes. On the other hand, for continental United States relatively many more white men than white women are discharged as not insane. This difference is perhaps due to the larger proportion of men committed to hospitals for the insane as alcoholics. The percentages of white persons discharged as unrecovered are in close correspondence for both sexes, with a slight preponderance in the proportion of unrecovered males.

The percentage of the total number of discharged colored reported as improved is smaller than of the white, but the difference is more than counterbalanced by the higher percentage of "not insane" among the colored. The unrecovered form a smaller percentage of the discharged colored than of the discharged white.

The female colored discharged show a larger percentage of improved than the male, but also relatively fewer classed as not insane. In the two state groups where colored insane are found in the largest numbers—the South Atlantic and South Central—there is a striking divergence in the percentages of the discharged classed as improved, which is due probably to the many returned as not insane in the first-mentioned division. There is also a notable difference in the percentages of unrecovered.

On the whole the possible classification of discharges not only does not lead to very definite conclusions, but can not, so long as the conditions of discharge are far from uniform in the different parts of the country. Meanwhile the significant fact remains that during 1904 a total of 22,524 persons were returned to society

from hospitals for the insane. Many of them, however, remained at least for a time under the custodial supervision of the hospital authorities.

The patients transferred from one hospital to another numbered 4,775 during 1904.

Deaths in hospitals.—Table 37 (page 196) shows the number of insane who died in hospitals during 1904, by age, sex, and color, for states and territories. The 14,434 that died included 13,163 white, of whom 7,614 were males and 5,549, females; and 1,271 colored (including Mongolians and Indians), of whom 673 were males and 598, females. The death rate in 1904 was as follows:

SEX.	NUMBER OF DEATHS PER 1,000 OF INSANE IN HOSPITALS: 1904.		
	Aggregate.	White.	Colored.
Both sexes.....	72.3	70.5	96.6
Males.....	78.2	76.9	96.8
Females.....	65.5	63.3	96.2

The colored insane show a much higher rate of mortality than the white. There is only a slight difference between the ratios for colored males and females, while for the white insane the death rate is much lower among females than among males.

Table xxvi shows the per cent distribution, by age, of the insane who died in hospitals during 1904, classified by color and sex.

TABLE XXVI.—Per cent distribution, by age, of insane dying in hospitals, classified by color and sex: 1904.

Only 1.2 per cent of the white insane who died in hospitals during 1904 were under 20 years of age, as compared with 3.9 per cent of the colored. In all 35.2 per cent of the white and 53.7 per cent of the colored died before the forty-sixth year had been reached. Of those who died in insane hospitals, the highest percentage for whites occurs in the age period 40 to 44

years, while for the colored it is found in the age period 65 to 69 years.

Among the white the percentages of deaths are uniformly lower for males than for females in the age periods under 35 years; they are higher for the former sex than for the latter in every age period between 35 and 75 years, except 45 to 49 and 55 to 59 years, but smaller in the later age periods. Or, to state it differently, 36 per cent of the white males and 34.2 per cent of the white females died before entering upon the forty-sixth year.

Among the colored, on the other hand, 52.5 per cent of the males and 55.2 per cent of the females died before reaching 45 years of age. Thus, whether considered in the aggregate or by sex, the duration of life among the white insane is much greater than among the colored.

The largest percentage of deaths for white males (11) occurred in the age period 40 to 44 years; for white females (9.2), in the age period 65 to 69 years; for colored males (10.6), in the age period 40 to 44

years; and for colored females (13.5), in the age period 25 to 29 years. In the age period, 65 to 69 years, the percentage of deaths for the several classes are as follows: White males, 10.1 per cent; white females, 9.2 per cent; colored males, 9.8 per cent; and colored females, 12.4 per cent. For every class the percentage of deaths in the last-mentioned period is considerably larger than in any of the quinquennial periods from 45 to 65 years. In all, 19.4 per cent of the white insane who died were more than 70 years old, as compared with 8.4 per cent of the colored.

Source of support.—Table 38 (page 202) shows, by sex, the number of insane in hospitals who are supported wholly at public expense, at private and public expense, and at private expense, for states and territories. No information with respect to the source of support was obtained in 1,025 cases.

Table xxvii shows the per cent distribution, by source of support, of the insane in hospitals at sometime during 1904, classified by sex, for main geographic divisions.

TABLE XXVII.—PER CENT DISTRIBUTION, BY SOURCE OF SUPPORT, OF INSANE IN HOSPITALS, CLASSIFIED BY SEX, FOR MAIN GEOGRAPHIC DIVISIONS: 1904.

¹ Less than one-tenth of 1 per cent.

It appears that in the aggregate 82.6 per cent of the insane are maintained wholly at public cost, 8.3 per cent contribute something to their own support, while 8.6 per cent are wholly provided for out of their own means or those of relatives or friends. The last-mentioned group consists largely of insane persons in private asylums. The percentage of insane maintained exclusively at public expense is largest in the South Atlantic and South Central states and smallest in the North Central. The first-mentioned state groups have comparatively few private hospitals, and in consequence smaller numbers supported wholly at private expense.

COST OF MAINTENANCE OF INSANE IN PUBLIC HOSPITALS.

A complete exhibit of the cost of the public care of the insane in the United States has not been attempted. The systems of bookkeeping differ so radically that it is practically impossible to obtain complete and comparable figures unless the matter is made the subject of a special inquiry. The reports of hospitals, state treasurers, or other officials vary materially in their definitions of current expense for maintenance. What one institution includes under this head another may credit to permanent improvements. For some states the

INSANE IN EACH PUBLIC HOSPITAL.

41

only available figures cover biennial periods. A further difficulty lies in the fact that a variety of fiscal periods are in use.

Table xxviii purports merely to give, as nearly as possible, the cost of maintenance of the insane in public hospitals, exclusive of the cost of permanent improvements, as well as of the income from pay patients and other sources.

The figures cover twelve months of the years 1903 and 1904, and in the case of most states the larger portion of that period is 1903.

The total cost of maintenance was \$21,329,228.41. The census of 1890 gives, under the head of current expense in public asylums for the year 1889, a total of \$10,595,567, and for building (permanent improvements) \$2,199,705.

¹ Includes nearly all of the state hospitals and only a few of the county institutions. No returns or no correct returns were received from those omitted.

² There were 22,639 of those in hospitals and 3,404 of those admitted to hospitals from 1890 to 1904, not classified by sex. This accounts for the discrepancies between the items and the totals.

FEEBLE-MINDED IN INSTITUTIONS

(203)

FEEBLE-MINDED IN INSTITUTIONS.

By JOHN KOREN, Expert Special Agent.

SCOPE OF INQUIRY.

Decennial enumerations of the feeble-minded in the United States have been made since 1850. In each census, from 1850 to 1890, inclusive, it was attempted to obtain returns for all the feeble-minded in the population. The enumerations were rather incomplete until 1880. In that year the work of the regular enumerators was supplemented by that of physicians, who reported more than 29 per cent of the 76,895 persons found to be "idiots." In 1880 the number of this class per 100,000 of population was 153.3. In 1890 the total number of feeble-minded enumerated was 95,609 and the corresponding ratio 152.7 per 100,000 of population. Physicians did not make any special reports of the feeble-minded at the census of 1890, which probably accounts for the ratio being slightly less in that year than in 1880.

The primary object of all previous enumerations of the feeble-minded has been to ascertain their numbers in the United States. In the present inquiry this object had to be abandoned, for the act of Congress of March 6, 1902, governing the work of the Bureau of the Census, expressly provided that enumerations of the so-called "special classes," which include the feeble-minded, must be restricted to inmates of institutions. In the case of the insane, and to a considerable extent in the case of paupers, this restriction does not wholly prevent an approximate quantitative measurement of the extent to which insanity and pauperism prevail in the country because a large proportion of each class is found in institutions. But of the feeble-minded relatively few are cared for in institutions of any kind. Of the 95,609 reported as feeble-minded at the census of 1890, only 5,254 were found in special institutions, and but 2,469 in asylums for the insane. The number of feeble-minded in almshouses was not ascertained.

Recent estimates made by competent authorities place the number of feeble-minded in the United States—that is, of persons so pronouncedly feeble-minded as to stand in need of institutional treatment—at not less than 150,000. Yet, on December

31, 1903, the entire population of special public and private institutions for the feeble-minded numbered only 14,347. There were, in addition, 16,551 supposedly feeble-minded persons among the inmates of almshouses.

It is obvious that the results of an enumeration restricted to the few feeble-minded in institutions can not be brought into comparison with the results of previous censuses, at which the object was to include all persons of this class whether encountered in or outside of institutions. One might, indeed, fairly question the utility of an enumeration of the relatively small number of feeble-minded who are inmates of institutions, since it can throw no light on the real numerical strength of this class, and therefore does not accomplish the chief object of such a census. Even facts in regard to the color, sex, age, nationality, race, geographic distribution, etc., of the relatively few feeble-minded who have been brought together in institutions, lose much of their significance so long as no inferences can be drawn from these facts in regard to the great mass of the feeble-minded who are not receiving institutional treatment.

Further, it is not feasible to enter upon a more intimate statistical study of a small group of this class at the present time. In fact, what belongs to the etiology of feeble-mindedness should be elucidated by medical experts rather than by statisticians, and so long as alienists make but little progress in diagnosing the origin of feeble-mindedness in the individuals under their personal observation, and accept with much reservation general statements in regard to the family history which would seem to bear some relation to the condition of their patients, it is extremely dangerous for statisticians to enter upon this field. Therefore the present investigation does not deal with the causes and kinds of feeble-mindedness, the family relations of the defective, nor any other aspect of the etiology of the individual case.

The inquiry purports merely to give in outline a statistical picture of the movement of population in special public and private institutions or schools for

the feeble-minded during twelve months, together with the general facts in regard to the color, sex, age, and nationality of the inmates. The feeble-minded in almshouses have not been included. Doubtless many persons in almshouses who are classified as feeble-minded are merely senile, and until the facts can be established more clearly it would only result in confusion to incorporate a group concerning which so little accurate knowledge is at hand. Moreover, the feeble-minded in almshouses have been accounted for in the Census Report on Paupers for 1904, and to include them here would not have aided materially in attaining what should be the primary object of an enumeration of the feeble-minded, namely, to determine the number and distribution of all the feeble-minded in the country. The importance of accomplishing this one object can not easily be overestimated. The existing provisions made for the institutional care of the feeble-minded are, on the whole, much less adequate than those for the other defective classes, and in many sections of the country they are wholly lacking. Little improvement, however, can be looked for so long as it is not even known how many stand in need of such care. State bureaus may supply the necessary facts in some instances, but for the most part they can be furnished only through the medium of the Bureau of the Census.

In addition to what positive value this report may possess, it has the negative value of calling attention to the need of an enumeration which shall comprehend the feeble-minded outside of institutions, thousands of whom urgently require institutional care.

GROWTH OF INSTITUTIONS FOR THE FEEBLE-MINDED, 1890 TO 1903.

The enumeration of 1890 covered the feeble-minded in 20 public and 4 private institutions especially

designed for this class. The present report deals with the inmates of 28 public and 14 private institutions. Thus in thirteen years there has been an addition of 8 public and 10 private institutions. Since 1890 the following states have established special public institutions for the feeble-minded: Michigan, Missouri, Nebraska, North Dakota, South Dakota, Washington, and Wisconsin. The public institutions are located in 23 states, of which only 3 (New Jersey, New York, and Pennsylvania) have more than 1. Colorado and Virginia have each 1 small private institution and no public. The following states are as yet without either public or private institutions for the feeble-minded: Maine, Vermont, Rhode Island, Delaware, District of Columbia, North Carolina, South Carolina, Georgia, Florida, Tennessee, Alabama, Mississippi, Louisiana, Texas, Indian Territory, Oklahoma, Arkansas, Montana, Wyoming, New Mexico, Arizona, Nevada, Idaho, and Oregon. In only one main geographic division—the North Central—is there a public institution for the feeble-minded in each state.

MOVEMENT OF POPULATION OF INSTITUTIONS FOR THE FEEBLE-MINDED DURING 1904.

Table 1 (page 217) shows for the feeble-minded in institutions, classified by color and sex, the number enumerated on December 31, 1903, the number admitted and the number discharged, dying, or transferred during 1904, and the number present on January 1, 1905, for states. Table 2 (page 218) gives the same information for the population of each institution for the feeble-minded, without distinction of sex. Table 1 summarizes the movement of population of institutions for the feeble-minded, classified by color and sex, for states, and shows the increase or decrease in numbers in twelve months.

¹ Not opened until 1904.

The population of all institutions on December 31, 1903, numbered 14,347; the admissions during 1904, 2,599; and the discharges, deaths, and transfers to other institutions, 1,435. For the twelve months, therefore, the number of feeble-minded in institutions increased by 1,164. The only decrease occurred at the Indiana School for Feeble-minded, where the population diminished by 19 in the twelve months. As yet, not a single state can assert that it affords institutional care for all of its feeble-minded youth. Indeed, there is probably not a single one among the older institutions that can by any means receive all for whose commitment application is made; and while this condition prevails, such a marked growth in numbers dur-

ing a year as is shown in Table I is only what should be expected. Furthermore, from the nature of the case, the feeble-minded form a more stable institutional population than any other class of defectives, and this will be true so long as institutions of necessity must restrict themselves to the reception of the least promising cases.

The comparative stability of the population of institutions for the feeble-minded is further illustrated in Table II, which shows for each state containing such an institution the number and percentage of admissions and of discharges, deaths, and transfers among the feeble-minded present in institutions at sometime during 1904.

FEEBLE-MINDED IN INSTITUTIONS.

TABLE II.—Number and per cent of admissions and of discharges, deaths, and transfers among feeble-minded in institutions during 1904, for states.

¹ Per cent not shown where base is less than 100.

The total discharges, deaths, and transfers during 1904 numbered 1,435, of which number 574 were removed by death and 212 were transferred to other institutions, so that less than one-half of the total were discharged from institutional care. A considerable variation will be observed in the per cents of discharges, deaths, and transfers shown for the different states. These per cents are, in general, probably less affected by the death rate and the numbers transferred to other institutions than by the policies governing dismissals. The tendency toward a permanent segregation of certain groups of the feeble-minded is much more marked in some states than in others. The percentages of admissions, when compared with those of discharges, deaths, and transfers, probably illustrate the demand for institutional care for the feeble-minded, in addition to showing the increase in population already noted.

ANALYSIS OF DATA, 1904.

Table III shows for the feeble-minded, classified by sex, color, nativity, and race, the number enumer-

ated in institutions on December 31, 1903, and the number admitted during 1904, for main geographic divisions.

Of the 14,347 inmates of institutions for feeble-minded on December 31, 1903, only 412 were in private institutions. The percentages of the above total for the main geographic divisions were as follows: North Atlantic, 39.7; South Atlantic, 2.4; North Central, 52; South Central, 1.3; and Western, 4.6. These figures indicate merely the extent to which provision is made for the care of feeble-minded in special institutions, and bear little relation to the actual number of these defectives in the population of the various sections of the country.

The colored inmates (including 1 Mongolian and 5 Indians) numbered 178, or 1.2 per cent of the aggregate on the given date. The institutions for the feeble-minded in the South Atlantic and South Central states do not receive colored persons. On December 31, 1903, about 2,500 colored feeble-minded were reported as inmates of almshouses, most of whom were accredited to the South Atlantic and South Central states.

Of the 14,169 white inmates, 85.8 per cent were native, 6 per cent foreign born, and 8.2 per cent of unknown nativity. The slight representation of the foreign born is natural. Feeble-mindedness, if not a congenital defect, is one which appears usually in early infancy, and children of immigrants so deficient mentally as to require commitment to institutions would certainly be excluded. Adult feeble-minded are not usually received by the special institutions, which are specifically intended as schools for the care and training of feeble-minded youth.

Among the native white inmates, 52.5 per cent were of native, 18.4 per cent of foreign, 12.9 per cent of mixed, and 16.2 per cent of unknown parentage. Since the inmates of special institutions constitute but a small proportion of the total feeble-minded and, moreover, are in a sense selected cases, it is impossible to make any deductions of value from the classification by nativity.

The admissions to institutions for the feeble-minded during 1904 numbered 2,599, and were distributed by main geographic divisions as follows: North Atlantic, 36.6 per cent; South Atlantic, 2.3 per cent; North Central, 53.9 per cent; South Central, 2.1 per cent; and Western, 5.1 per cent. Of the white persons admitted, 89.7 per cent were native, 7.1 per cent foreign born, and 3.2 per cent of unknown nativity. The per cent distribution by parentage, of the native whites admitted during 1904, corresponds closely to that noted for the native white inmates on December 31, 1903.

ANALYSIS OF DATA.

FEEBLE-MINDED IN INSTITUTIONS.

Sex.—Table IV shows the per cent distribution, by sex, of the feeble-minded who were either enumerated in institutions on December 31, 1903, or admitted during 1904, for main geographic divisions.

TABLE IV.—Per cent distribution, by sex, of feeble-minded in institutions, for main geographic divisions: 1904.

SEX.	PER CENT DISTRIBUTION OF FEEBLE-MINDED IN INSTITUTIONS: 1904.					
	Conti- nental United States.	North Atlan- tic di- vision.	South Atlan- tic di- vision.	North Cen- tral di- vision.	South Cen- tral di- vision.	West- ern di- vision.
Both sexes.....	100.0	100.0	100.0	100.0	100.0	100.0
Males.....	53.8	53.0	57.9	53.9	57.8	55.2
Females.....	46.2	47.0	42.1	46.1	42.2	44.8

The excess of males is pronounced in each of the state groups; and in the institutions of the North Atlantic and the North Central divisions, which contain 15,510 of the 16,946 feeble-minded involved, the percentages of males are very nearly identical. A preponderance of males among the feeble-minded was shown at the census of 1890 and in the report on paupers in almshouses for 1904, so that in this respect the returns from institutions probably reflect accurately the sex distribution in this class of defectives. When the per cent distribution by sex is considered for each race and nativity class, as shown in Table V, the males are found to be in the majority among the colored as well as among the white in each group of known nativity and parentage.

TABLE V.—Per cent distribution, by sex, of feeble-minded in institutions, classified by color, nativity, and race: 1904.

¹ Per cent not shown where base is less than 100.

Among the white feeble-minded of known nativity the number of native feeble-minded was 14,456, or 93.4 per cent, and of foreign born, 1,038, or 6.6 per cent. The largest percentage of foreign born among the white feeble-minded, 17.3, is found in Ohio, which is followed by Minnesota with 12.6 per cent, and New York with 12.1. In other states having exceptionally large foreign populations the percentages of foreign born among the white feeble-minded in institutions are in all cases under 10. It is probable, therefore, that in most instances the number of foreign born white feeble-minded in the population of a state bears little relation to the number that happens to be committed to institutions.

Parentage of native white feeble-minded.—Table VII shows the per cent distribution, by nativity of parents, of the native white feeble-minded of known parentage who were inmates of institutions at sometime during 1904, for main geographic divisions.

TABLE VII.—*Per cent distribution, by nativity of parents, of native white feeble-minded of known parentage in institutions, for main geographic divisions: 1904.*

¹ Per cent not shown where base is less than 100.² Having one parent native and the other foreign, or one parent unknown and the other either native or foreign.

The apparent prevalence of feeble-mindedness among native white children of foreign parentage has been much commented upon. This view in the Census Report on the Insane, etc., for 1890 (page 75) is confirmed, as follows: "The proportion of feeble-minded under 25 years of age . . . is greater among the (native) white children of foreign born parents than among those of native parents."

The figures from which the per cents in Table VII are derived are of course too small to permit general deductions. But when the reluctance with which foreign parents seek the commitment of their children to institutions is considered, the comparatively large percentages of persons of foreign parentage among the native white feeble-minded point to the greater prevalence of feeble-mindedness among these than among the native whites of native parentage.

Nationality of foreign born white feeble-minded.—According to Table III among the white feeble-minded of known nativity who were either enumerated in institutions on December 31, 1903, or admitted during 1904, a total of 1,038 were foreign born. The per cent distribution of this number, by country of birth, is shown in Table VIII.

In view of the small numbers of the foreign born white feeble-minded it would be unfair to infer that the different nationalities represented contribute feeble-minded to the population in the proportion in which their children are committed to special institutions. The extent to which these institutions are utilized by any foreign element may, self-evidently, be wholly unrelated to its numbers standing in need of institutional care. Nevertheless it is interesting to note the percentage of feeble-minded German born, 26.4, which is very large as compared, for instance, with that for the Irish born, which was only 7. Yet it is known that both in almshouses and in hospitals for the insane the percentage of Irish born is larger than that of any other foreign nationality. The percentages of feeble-minded born in Canada, 14.4, and of those born in Russia and Poland, 12.2; are also unexpectedly large and out of keeping with the repre-

sentation of these nationalities in almshouses and hospitals for the insane. The percentage of Scandinavian feeble-minded likewise seems exceptionally great. For the other nationalities the figures correspond more closely to known facts concerning other groups of dependents and defectives belonging to them.

Present age.—Table 7 (page 223) shows the feeble-minded who were inmates of institutions at some time during 1904, classified by color, nativity, race, sex, and age in quinquennial periods. The feeble-minded admitted to institutions during 1904 are distributed by years of age in Table 8 (page 224).

Of the feeble-minded inmates of institutions at some time during 1904, 16,655, of whom 8,967 were males and 7,688 females, were of known age under 100 years. The per cent distribution by age is given in Table ix.

In the age groups under 20 years were found 58 per cent of all the feeble-minded of known age, with the highest percentages, 22.9 and 24.4, in the age groups 10 to 14 years and 15 to 19 years, respectively. The age group 20 to 24 years contained 16.7 per cent of all the inmates, and that 25 to 29 years 10.4 per cent, so that in all, 85.1 per cent were found to be under 30 years of age. The numbers in each of the succeeding age groups diminish rapidly. Relatively more females than males were found in the adult age groups, beginning with that 20 to 24 years. Here and there an inmate was found who had reached the age of 55 or more. The comparative youthfulness of the large majority of the feeble-minded in special institutions is

determined not only by the prevailing policies in regard to admissions and discharges, which as a rule restrict the privileges of the institutions to children or young people and provide for the dismissal of all who can safely be sent away, but also, as will be shown later, by the rate of mortality in this class of defectives.

TABLE IX.—Per cent distribution, by age, of feeble-minded of known age under 100 years in institutions, classified by sex: 1904.

Age at admission.—The age distribution of the 2,599 feeble-minded admitted to institutions during 1904 is shown in Table 8. Since the age at admission is not subject to any marked change from year to year, the age distribution of those admitted during 1904 may be considered as typical. The per cent distribution, by age, of the feeble-minded admitted to institutions during 1904 is given in Table x, for main geographic divisions.

¹ Per cent not shown where base is less than 100.

² Less than one-tenth of 1 per cent.

Only 1.7 per cent of the total persons admitted to institutions during 1904 were infants under 5 years of age; but 21.8 per cent of those admitted were from 5 to 9 years of age; 33 per cent, from 10 to 14; and 20.7 per cent, from 15 to 19; so that in all 77.2 per cent of the admissions occurred before the 20th year of life had been reached. The admissions at the ages from 15 to 19 years were more than twice as numerous as in the age group 20 to 24 years, and in the subsequent age periods the numbers admitted diminish rapidly. Yet the admissions between the ages of 20 and 39 years constitute 18.3 per cent of the total number. The occasional commitments of persons above the age of 30 are presumably made for the purpose of safe-keeping rather than with the hope of training and educating the individual. The per cent distribution, by age, of those admitted during 1904 is very nearly the same for the North Atlantic and the North Central states, in which most of the institutions for the feeble-minded are located. The first-mentioned group appears to receive a relatively larger number of infants under 5 years of age, and the second to admit a proportionally larger number of adults between the ages of 20 and 45 years.

Physical defects.—Table 9 (page 226) shows the feeble-minded in institutions at sometime during 1904, classified by color, nativity, race, and sex, who were found to be epileptic, blind, deaf-mute, paralytic, and crippled, maimed, or deformed, for main geographic divisions. The total number involved was 5,124, or 30.2 per cent of all the feeble-minded in institutions. Table xi shows the per cent of the feeble-minded in institutions, classified by sex, color, nativity, and race, who have some one of the specified physical defects.

More than three-tenths, or 30.2 per cent, of the feeble-minded in institutions were defective in other ways. Among this class epilepsy seems to have been the most common additional defect, as nearly three-fifths of them were epileptics. The maimed, crippled, or deformed were slightly more numerous than the paralytics, who constituted nearly one-sixth of those with additional defects. The proportions of deaf-mutes and of blind among this class were small. Of the 16,946 feeble-minded, 3,015, or 17.8 per cent, were epileptic; 125, or 0.7 per cent, blind; 278, or 1.6 per cent, deaf-mutes; 850, or 5 per cent, paralytic; and 856, or 5.1 per cent, crippled, maimed, or deformed. The percentages for each sex are nearly the same as those for the total. So far as sex, color, and nativity are concerned, however, the figures hardly permit any general deductions, as the data concerning the feeble-minded in the general population are wanting. The proportion of the feeble-minded with other defects varies greatly in the different divisions, for which the percentages are as follows: North Atlantic, 25.4 per cent; South Atlantic, 43.3 per cent; North Central, 33 per cent; South Central, 29.5 per cent; and Western, 33.3 per cent. The institutions of the North Atlantic states reported 11.3 per cent of the feeble-

minged as epileptic, while those of the North Central states reported 21.9 per cent. For the blind, deaf-mute, paralytic and maimed, crippled, or deformed

among the feeble-minded the institutions of the two state groups show generally corresponding percentages.

Discharges from institutions.—Table 10 (page 228) shows that of the total number of feeble-minded inmates of institutions at sometime during 1904, 1,435, or 8.5 per cent, had died, been transferred to other institutions, or discharged during the year. Of these 1,435 patients, 649, or 45.2 per cent, were discharged; 574, or 40 per cent, died; and 212, or 14.8 per cent, were transferred to other institutions. Table 10 also shows for those discharged the custody into which they were given and their condition at the time of dismissal. Table XII shows the per cent distribution of the feeble-minded discharged from institutions during 1904, not only by the custody into which they were given, but also by their condition at the time of dismissal.

TABLE XII.—Per cent distribution, by custody and condition, of feeble-minded discharged from institutions, for main geographic divisions: 1904.

CUSTODY AND CONDITION AT DISCHARGE.	FEEBLE-MINDED DISCHARGED FROM INSTITUTIONS: 1904.

¹ Per cent not shown where base is less than 100.

Of the 649 persons discharged, 571, or 88 per cent, were returned to their relatives or friends, and 57, or 8.8 per cent, were reported as not having been discharged into the special custody of other persons. Concerning 21, or 3.2 per cent, the facts were not stated. From the institutions of both the North Atlantic and the North Central states, which are the most numerous and important, the great majority of the feeble-minded discharged were sent back to relatives or friends.

Probably no really feeble-minded person can be said ever to recover fully. It seemed unnecessary, therefore, to make any other distinction concerning the condition when discharged from institutions than as between those who were improved and those who remained unimproved. Of the 649 persons discharged, 354, or 54.5 per cent, were reported as improved, and 116, or 17.9 per cent, as unimproved. The condition of 179, or 27.6 per cent, was not stated. The institutions of the North Atlantic states reported 79 per cent of the discharged to be improved, as compared with 25.1 per cent for the institutions of the North Central states; but the latter made no report in 58.4 per cent of the total number of discharges, as compared with 6.5 per cent in the former. No explanation of this discrepancy between the relative numbers returned as improved from the institutions of these two state groups is at hand.

Deaths in institutions.—Table 11 (page 229) shows the feeble-minded who died in institutions at sometime during 1904, classified by age and sex, for states. The persons who died numbered 574, of whom 325 were males and 249 females. Table XIII shows the per cent distribution, by age, of these feeble-minded, without distinction of sex, for main geographic divisions.

FEEBLE-MINDED IN INSTITUTIONS.

Age unknown.....	0.5	1.0	(1)	0.3	(1)	(1)

¹ Per cent not shown where base is less than 100.

Since about 85 per cent of all the feeble-minded in institutions were under 30 years of age, the majority of deaths must obviously be looked for in the age groups under 30 years; and in all, 80 per cent died at ages under 30 years. The age group under 5 years showed about 0.6 per cent of the total and yielded 1.9 per cent of the deaths. In the age groups 5 to 9 years and 10 to 14 years occurred, respectively, 9.6 per cent and 16.9 per cent of the deaths, the maximum percentage, 22.8, being reached in the age group 15 to 19 years. In keeping with the smaller total representation involved the percentages of deaths show a marked decline in the higher age groups, beginning with 20 to 24 years and continuing with but few exceptions throughout the remaining quinquennial periods. The differences between the percentages of deaths in the different age groups in the North Atlantic states and those in the North Central are of course due largely to the different age distributions of the feeble-minded.

Source of support.—Table 12 (page 230) shows the numbers of feeble-minded in institutions at some time during 1904 who were maintained at public expense, at public and private expense, or at private expense. Table XIV gives the per cent distribution, by source of support, of these feeble-minded, for main geographic divisions.

TABLE XIV.—*Per cent distribution, by source of support, of feeble-minded in institutions, for main geographic divisions: 1904.*

SOURCE OF SUPPORT.	PER CENT DISTRIBUTION OF FEEBLE-MINDED IN INSTITUTIONS: 1904.					
	Conti- nental United States	North Atlan- tic di- vision.	South Atlan- tic di- vision.	North Cen- tral di- vision.	South Cen- tral di- vision.	West- ern divi- sion.
All sources.....	100.0	100.0	100.0	100.0	100.0	100.0
Public expense.....	81.5	89.7	86.7	75.9	75.0	73.8
Public and private expense.....	10.8	4.1	0.5	16.2	0.8	15.5
Private expense.....	7.7	6.2	12.8	7.9	24.2	10.7

As nearly all the feeble-minded enumerated are cared for in institutions maintained at state expense, it is perhaps natural that the gratuitous support afforded should be generally accepted. Most inmates, moreover, are drawn from the families of the poor. In all, 81.5 per cent of the feeble-minded in institutions were cared for wholly at public expense. This class of the feeble-minded constituted but 75.9 per cent of the total in the North Central states, and only 73.8 per cent in the Western division, while it formed 89.7 per cent of the total in the North Atlantic states. That this difference is probably due to a more systematic effort in the North Central and Western states to make the relatives of the feeble-minded contribute to their support, is indicated by the fact that 16.2 per cent in the North Central and 15.5 per cent in the Western states were supported in part at private expense, while only 4.1 per cent in the North Atlantic division were so supported.
